1. **Introduction**

Every feature present in DNF should be based on a reasonable use case. All the supported use cases are supposed to be enumerated in this document.

In case you use DNF to achieve a goal which is not documented here, either you found an error in the documentation or you misuse DNF. In either case we would appreciate if you share the case with us so we can help you to use DNF in the correct way or add the case to the list. You can only benefit from such a report because then you can be sure that the behavior that you expect will not change without prior notice in the *DNF Release Notes* and that the behavior will be covered by our test suite.
Important: Please consult every usage of DNF with our reference documentation to be sure what are you doing. The examples mentioned here are supposed to be as simple as possible and may ignore some minor corner cases.

Warning: The list is not complete yet - the use cases are being added incrementally these days.

1.2 General assumptions

The user in question must have the appropriate permissions.

1.3 Ensure that my system contains given mix of features (packages/files/providers/groups)

A system administrator has a list of features that has to be present in an operating system. The features must be provided by RPM packages in system repositories that must be accessible.

A feature may be for example a concrete version of a package (hawkey-0.5.3-1.fc21.i686), a pathname of a binary RPM file (/var/lib/mock/fedora-21-i386/result/hawkey-0.5.3-2.20150116gitd002ec90.fc21.i686.rpm), an URL of a binary RPM file (http://jenkins.cloud.fedoraproject.org/job/DNF/lastSuccessfulBuild/artifact/fedora-21-i386-build/hawkey-0.5.3-99.649.20150116gitd002c90233fc96893806836a258f14a0e0cf47.fc21.i686.rpm), a configuration file (/etc/yum.repos.d/fedora-rawhide.repo), a language interpreter (ruby(runtime_executable)), an extension (python3-dnf), a support for building modules for the current running kernel (kernel-devel-uname-r = $(uname -r)), an executable (*/binaryname) or a collection of packages specified by any available identifier (kde-desktop).

The most recent packages that provide the missing features and suit installation (that are not obsoleted and do not conflict with each other or with the other installed packages) are installed if the given feature is not present already. If any of the packages cannot be installed, the operation fails.

1.3.1 CLI

```bash
SPECS="hawkey-0.5.3-1.fc21.i686 @kde-desktop" # Set the features here.
dnf install $SPECS
```

1.3.2 Plugins/CLI API

```python
"""A plugin that ensures that given features are present."""

```import dnf.cli```
```from dnf.i18n import _```
```from dnf.cli.option_parser import OptionParser```
```# The parent class allows registration to the CLI manager.```
```(continues on next page)```
class Command(dnf.cli.Command):

    """A command that ensures that given features are present."""

    # An alias is needed to invoke the command from command line.
    aliases = ['foo']  # <-- SET YOUR ALIAS HERE.

    def configure(self):
        """Setup the demands."""
        # Repositories are needed if we want to install anything.
        self.cli.demands.available_repos = True
        # A sack is required by marking methods and dependency resolving.
        self.cli.demands.sack_activation = True
        # Resolving performs a transaction that installs the packages.
        self.cli.demands.resolving = True
        # Based on the system, privileges are required to do an installation.
        self.cli.demands.root_user = True  # <-- SET YOUR FLAG HERE.

    @staticmethod
    def set_argparser(parser):
        """Parse command line arguments."""
        parser.add_argument('package', nargs='+', metavar=_('PACKAGE'),
                            action=OptionParser.ParseSpecGroupFileCallback,
                            help=_('Package to install'))

    def run(self):
        """Run the command."""
        # Feature marking methods set the user request.
        for ftr_spec in self.opts.pkg_specs:
            try:
                self.base.install(ftr_spec)
            except dnf.exceptions.MarkingError:
                raise dnf.exceptions.Error('feature(s) not found: ' + ftr_spec)
        # Package marking methods set the user request.
        for pkg in self.base.add_remote_rpms(self.opts.filenames, strict=False):
            try:
                self.base.package_install(pkg, strict=False)
            except dnf.exceptions.MarkingError as e:
                raise dnf.exceptions.Error(e)
        # Comps data reading initializes the base.comps attribute.
        if self.opts.grp_specs:
            self.base.read_comps(arch_filter=True)
        # Group marking methods set the user request.
        for grp_spec in self.opts.grp_specs:
            group = self.base.comps.group_by_pattern(grp_spec)
            if not group:
                raise dnf.exceptions.Error('group not found: ' + grp_spec)
            self.base.group_install(group.id, ['mandatory', 'default'])

    # Every plugin must be a subclass of dnf.Plugin.
    class Plugin(dnf.Plugin):

        """A plugin that registers our custom command."""

        # Every plugin must provide its name.
        name = 'foo'  # <-- SET YOUR NAME HERE.
# Every plugin must provide its own initialization function.

def __init__(self, base, cli):
    """Initialize the plugin."""
    super(Plugin, self).__init__(base, cli)
    if cli:
        cli.register_command(Command)

If it makes a sense, the plugin can do the operation in appropriate hooks instead of registering a new command that needs to be called from the command line.

## 1.3.3 Extension API

"""An extension that ensures that given features are present."""

```python
import sys
import dnf
import dnf.module
import dnf.rpm

if __name__ == '__main__':
    FTR_SPECS = {'acpi-1.7-10.fc29.x86_64'}  # <-- SET YOUR FEATURES HERE.
    RPM_SPECS = {'./acpi-1.7-10.fc29.x86_64.rpm'}  # <-- SET YOUR RPMS HERE.
    GRP_SPECS = {'kde-desktop'}  # <-- SET YOUR GROUPS HERE.
    MODULE_SPEC = {'nodejs:10/default'}  # <-- SET YOUR MODULES HERE.

    with dnf.Base() as base:
        # Substitutions are needed for correct interpretation of repo files.
        RELEASEVER = dnf.rpm.detect_releasever(base.conf.installroot)
        base.conf.substitutions['releasever'] = RELEASEVER
        # Repositories are needed if we want to install anything.
        base.read_all_repos()
        # A sack is required by marking methods and dependency resolving.
        base.fill_sack()
        # Feature marking methods set the user request.
        for ftr_spec in FTR_SPECS:
            try:
                base.install(ftr_spec)
            except dnf.exceptions.MarkingError:
                sys.exit('Feature(s) cannot be found: ' + ftr_spec)
        # Package marking methods set the user request.
        for pkg in base.add_remote_rpms(RPM_SPECS, strict=False):
            try:
                base.package_install(pkg, strict=False)
            except dnf.exceptions.MarkingError:
                sys.exit('RPM cannot be found: ' + pkg)
        # Comps data reading initializes the base.comps attribute.
        if GRP_SPECS:
            base.read_comps(arch_filter=True)
        # Group marking methods set the user request.
        if MODULE_SPEC:
            module_base = dnf.module.module_base.ModuleBase(base)
```

(continues on next page)
module_base.install(MODULE_SPEC, strict=False)
for grp_spec in GRP_SPECS:
    group = base.comps.group_by_pattern(grp_spec)
    if not group:
        sys.exit('Group cannot be found: ' + grp_spec)
    base.group_install(group.id, ['mandatory', 'default'])
# Resolving finds a transaction that allows the package's installation.
try:
    base.resolve()
except dnf.exceptions.DepsolveError:
    sys.exit('Dependencies cannot be resolved.')
# The packages to be installed must be downloaded first.
try:
    base.download_packages(base.transaction.install_set)
except dnf.exceptions.DownloadError:
    sys.exit('Required package cannot be downloaded.')
# The request can finally be fulfilled.
base.do_transaction()

1.4 Get a list of available packages filtered by their relation to the system

A system user wants to obtain a list of available RPM packages for their consecutive automatic processing or for informative purpose only. The list of RPM packages is filtered by requested relation to the system or user provided <package-name-specs>. The obtained list of packages is based on available data supplied by accessible system repositories.

A relation to the system might be for example one of the following:

- installed - packages already installed on the system
- available - packages available in any accessible repository
- extras - packages installed on the system not available in any known repository
- obsoletes - installed packages that are obsoleted by packages in any accessible repository
- recent - packages recently added into accessible repositories
- upgrades - available packages upgrading some installed packages

1.4.1 CLI

dnf list *dnf*
dnf list installed *debuginfo*
dnf list available gtk*devel*
dnf list extras
dnf list obsoletes
dnf list recent
dnf list upgrades
1.4.2 Plugins/CLI API

"""A plugin that lists installed packages that are obsoleted by any available package""

from dnf.i18n import _
import dnf
import dnf.cli

# If you only plan to create a new dnf subcommand in a plugin
# you can use @dnf.plugin.register_command decorator instead of creating
# a Plugin class which only registers the command
# (for full-fledged Plugin class see examples/install_plugin.py)
@dnf.plugin.register_command
class Command(dnf.cli.Command):

"""A command that lists packages installed on the system that are
obsoleted by packages in any known repository.""

# An alias is needed to invoke the command from command line.
aliases = ['foo'] # <-- SET YOUR ALIAS HERE.

@staticmethod
def set_argparser(parser):
    parser.add_argument("package", nargs='*', metavar=_('PACKAGE'))

def configure(self):
    """Setup the demands.""
    # Repositories serve as sources of information about packages.
    self.cli.demands.available_repos = True
    # A sack is needed for querying.
    self.cli.demands.sack_activation = True

def run(self):
    """Run the command.""
    obs_tuples = []
    # A query matches all available packages
    q = self.base.sack.query()
    if not self.opts.package:
        # Narrow down query to match only installed packages
        inst = q.installed()
        # A dictionary containing list of obsoleted packages
        for new in q.filter(obsoletes=inst):
            obs_reldeps = new.obsoletes
            obsoleted = inst.filter(provides=obs_reldeps).run()
            obs_tuples.extend([(new, old) for old in obsoleted])
    else:
        for pkg_spec in self.opts.package:
            subj = self.base.sack.get_subj(pkg_spec)
            subj = dnf.subject.Subject(pkg_spec)
            # A query restricted to installed packages matching given
subject

```python
inst = subj.get_best_query(self.base.sack).installed()
for new in q.filter(obsoletes=inst):
    obs_reldeps = new.obsoletes
    obsoleted = inst.filter(provides=obs_reldeps).run()
    obs_tuples.extend([(new, old) for old in obsoleted])

if not obs_tuples:
    raise dnf.exceptions.Error('No matching Packages to list')

for (new, old) in obs_tuples:
    print('%s.%s obsoletes %s.%s' %
          (new.name, new.arch, old.name, old.arch))
```

1.4.3 Extension API

```python
"""An extension that lists installed packages not available in any remote repository.
"""

import dnf

if __name__ == '__main__':
    with dnf.Base() as base:
        # Repositories serve as sources of information about packages.
        base.read_all_repos()
        # A sack is needed for querying.
        base.fill_sack()

        # A query matches all packages in sack
        q = base.sack.query()

        # Derived query matches only available packages
        q_avail = q.available()
        # Derived query matches only installed packages
        q_inst = q.installed()

        available = q_avail.run()
        for pkg in q_inst.run():
            if pkg not in available:
                print(str(pkg))
```
2.1 Synopsis

dnf [options] <command> [<args>...]

2.2 Description

‘DNF’ is the next upcoming major version of ‘YUM’, a package manager for RPM-based Linux distributions. It roughly maintains CLI compatibility with YUM and defines a strict API for extensions and plugins.

Plugins can modify or extend features of DNF or provide additional CLI commands on top of those mentioned below. If you know the name of such a command (including commands mentioned below), you may find/install the package which provides it using the appropriate virtual provide in the form of dnf-command(<alias>), where <alias> is the name of the command; e.g. ‘dnf install dnf-command(versionlock)’ installs a versionlock plugin. This approach also applies to specifying dependencies of packages that require a particular DNF command.

Return values:

- 0: Operation was successful.
- 1: An error occurred, which was handled by dnf.
- 3: An unknown unhandled error occurred during operation.
- 100: See check-update
- 200: There was a problem with acquiring or releasing of locks.

Available commands:

- alias
- autoremove
- check
- check-update
• clean
• deplist
• distro-sync
• downgrade
• group
• help
• history
• info
• install
• list
• makecache
• mark
• module
• provides
• reinstall
• remove
• repoinfo
• repolist
• repoquery
• repository-packages
• search
• shell
• swap
• updateinfo
• upgrade
• upgrade-minimal

Additional information:

• Options
• Specifying Packages
• Specifying Provides
• Specifying File Provides
• Specifying Groups
• Specifying Transactions
• Metadata Synchronization
• Configuration Files Replacement Policy
• Files
2.3 Options

- 4 Resolve to IPv4 addresses only.
- 6 Resolve to IPv6 addresses only.

\(--\text{advisory}=<\text{advisory}>\), \(--\text{advisories}=<\text{advisory}>\) Include packages corresponding to the advisory ID, Eg. FEDORA-2201-123. Applicable for the install, repoquery, updateinfo and upgrade commands.

\(--\text{allowerasin}g\) Allowing erasing of installed packages to resolve dependencies. This option could be used as an alternative to the \text{yum swap} command where packages to remove are not explicitly defined.

\(--\text{assumeno}\) Automatically answer no for all questions.

\(-b\), \(--\text{best}\) Try the best available package versions in transactions. Specifically during \text{dnf upgrade}, which by default skips over updates that can not be installed for dependency reasons, the switch forces DNF to only consider the latest packages. When running into packages with broken dependencies, DNF will fail giving a reason why the latest version can not be installed.

Note that the use of the newest available version is only guaranteed for the packages directly requested (e.g. as a command line arguments), and the solver may use older versions of dependencies to meet their requirements.

\(--\text{bugfix}\) Include packages that fix a bugfix issue. Applicable for the install, repoquery, updateinfo and upgrade commands.

\(--\text{bz}=<\text{bugzilla}>\), \(--\text{bzs}=<\text{bugzilla}>\) Include packages that fix a Bugzilla ID, Eg. 123123. Applicable for the install, repoquery, updateinfo and upgrade commands.

\(-c\), \(--\text{cacheonly}\) Run entirely from system cache, don’t update the cache and use it even in case it is expired.

DNF uses a separate cache for each user under which it executes. The cache for the root user is called the system cache. This switch allows a regular user read-only access to the system cache, which usually is more fresh than the user’s and thus he does not have to wait for metadata sync.

\(--\text{color}=<\text{color}>\) Control whether color is used in terminal output. Valid values are always, never and auto (default).

\(--\text{comment}=<\text{comment}>\) Add a comment to the transaction history.

\(-c\ <\text{config file}>\), \(--\text{config}=<\text{config file}>\) Configuration file location.

\(--\text{cve}=<\text{cves}>\), \(--\text{cves}=<\text{cves}>\) Include packages that fix a CVE (Common Vulnerabilities and Exposures) ID (http://cve.mitre.org/about/), Eg. CVE-2201-0123. Applicable for the install, repoquery, updateinfo, and upgrade commands.

\(-d\ <\text{debug level}>\), \(--\text{debuglevel}=<\text{debug level}>\) Debugging output level. This is an integer value between 0 (no additional information strings) and 10 (shows all debugging information, even that not understandable to the user), default is 2. Deprecated, use \text{-v} instead.

\(--\text{debugsolver}\) Dump data aiding in dependency solver debugging into ./debugdata.

\(--\text{disableexcludes}=[\text{all}|\text{main}|\text{<repoid}>]\), \(--\text{disableexcludepkgs}=[\text{all}|\text{main}|\text{<repoid}>]\) Disable the configuration file excludes. Takes one of the following three options:

- all, disables all configuration file excludes
- main, disables excludes defined in the [main] section
- repoid, disables excludes defined for the given repository
--disable, --set-disabled Disable specified repositories (automatically saves). The option has to be used together with the config-manager command (dnf-plugins-core).

--disableplugin=<plugin names> Disable the listed plugins specified by names or globs.

--disablerepo=<repoid> Disable specific repositories by an id or a glob. This option is mutually exclusive with --repo.

--downloaddir=<path>, --destdir=<path> Redirect downloaded packages to provided directory. The option has to be used together with the --downloadonly command line option, with the download command (dnf-plugins-core) or with the system-upgrade command (dnf-plugins-extras).

--downloadonly Download the resolved package set without performing any rpm transaction (install/upgrade/erase).

-e <error level>, --errorlevel=<error level> Error output level. This is an integer value between 0 (no error output) and 10 (shows all error messages), default is 3. Deprecated, use -v instead.

--enable, --set-enabled Enable specified repositories (automatically saves). The option has to be used together with the config-manager command (dnf-plugins-core).

--enableplugin=<plugin names> Enable the listed plugins specified by names or globs.

--enablerepo=<repoid> Enable additional repositories by an id or a glob.

--enhancement Include enhancement relevant packages. Applicable for the install, repoquery, updateinfo and upgrade commands.

-x <package-file-spec>, --exclude=<package-file-spec> Exclude packages specified by <package-file-spec> from the operation.

--excludepkgs=<package-file-spec> Deprecated option. It was replaced by the --exclude option.

--forcearch=<arch> Force the use of an architecture. Any architecture can be specified. However, use of an architecture not supported natively by your CPU will require emulation of some kind. This is usually through QEMU. The behavior of --forcearch can be configured by using the arch and ignorearch configuration options with values <arch> and True respectively.

-h, --help, --help-cmd Show the help.

--installroot=<path> Specifies an alternative installroot, relative to where all packages will be installed. Think of this like doing chroot <root> dnf, except using --installroot allows dnf to work before the chroot is created. It requires absolute path.

- cachedir, log files, releasever, and gpgkey are taken from or stored in the installroot. Gpgkeys are imported into the installroot from a path relative to the host which can be specified in the repository section of configuration files.

- configuration file and reposdir are searched inside the installroot first. If they are not present, they are taken from the host system. Note: When a path is specified within a command line argument (--config=<config file> in case of configuration file and --setopt=reposdir=<reposdir> for reposdir) then this path is always relative to the host with no exceptions.

- vars are taken from the host system or installroot according to reposdir. When reposdir path is specified within a command line argument, vars are taken from the installroot. When varsdir paths are specified within a command line argument (--setopt=varsdir=<reposdir>) then those path are always relative to the host with no exceptions.

- The pluginpath and pluginconfpath are relative to the host.

Note: You may also want to use the command-line option --releasever=<release> when creating the installroot, otherwise the $releasever value is taken from the rpmdb within the installroot (and thus it is empty at the time of creation and the transaction will fail). If --releasever=/ is used, the releaserver
will be detected from the host (/) system. The new installroot path at the time of creation does not contain the repository, releasever and dnf.conf files.

On a modular system you may also want to use the --setopt=module_platform_id=<module_platform_name:stream> command-line option when creating the installroot, otherwise the module_platform_id value will be taken from the /etc/os-release file within the installroot (and thus it will be empty at the time of creation, the modular dependency could be unsatisfied and modules content could be excluded).

Installroot examples:

```
dnf --installroot=<installroot> --releasever=<release> install system-release
```
Permanently sets the releasever of the system in the <installroot> directory to <release>.

```
dnf --installroot=<installroot> --setopt=reposdir=<path> --config /path/dnf.conf upgrade
```
Upgrades packages inside the installroot from a repository described by --setopt using configuration from /path/dnf.conf.

```
--newpackage
```
Include newpackage relevant packages. Applicable for the install, repoquery, updateinfo and upgrade commands.

```
--noautoremove
```
Disable removal of dependencies that are no longer used. It sets clean_requirements_on_remove configuration option to False.

```
--nobest
```
Set best option to False, so that transactions are not limited to best candidates only.

```
--nodoc
```
Do not install documentation. Sets the rpm flag ‘RPMTRANS_FLAG_NODOCS’.

```
--nogpgcheck
```
Skip checking GPG signatures on packages (if RPM policy allows).

```
--nopugins
```
Disable all plugins.

```
--obsoletes
```
This option has an effect on an install/update, it enables dnf’s obsoletes processing logic. For more information see the obsoletes option.

This option also displays capabilities that the package obsoletes when used together with the repoquery command.

Configuration Option: obsoletes

```
-q, --quiet
```
In combination with a non-interactive command, shows just the relevant content. Suppresses messages notifying about the current state or actions of DNF.

```
-R <minutes>, --randomwait=<minutes>
```
Maximum command wait time.

```
--refresh
```
Set metadata as expired before running the command.

```
--releasever=<release>
```
Configure DNF as if the distribution release was <release>. This can affect cache paths, values in configuration files and mirrorlist URLs.

```
--repofrompath <repo>,<path/url>
```
Specify a repository to add to the repositories for this query. This option can be used multiple times.

- The repository label is specified by <repo>.
- The path or url to the repository is specified by <path/url>. It is the same path as a baseurl and can be also enriched by the repo variables.
- The configuration for the repository can be adjusted using --setopt=repo.<option>=<value>.
- If you want to view only packages from this repository, combine this with the --repo=<repo> or --disablerepo="*" switches.
--repo=<repoid>, --repoid=<repoid> Enable just specific repositories by an id or a glob. Can be used multiple times with accumulative effect. It is basically a shortcut for --disablerepo="*" --enablerepo=<repoid> and is mutually exclusive with the --disablerepo option.

--rpmverbosity=<name> RPM debug scriptlet output level. Sets the debug level to <name> for RPM scriptlets. For available levels, see the rpmverbosity configuration option.

--sec-severity=<severity>, --secseverity=<severity> Includes packages that provide a fix for an issue of the specified severity. Applicable for the install, repoquery, updateinfo and upgrade commands.

--security Includes packages that provide a fix for a security issue. Applicable for the upgrade command.

--setopt=<option>=<value> Override a configuration option from the configuration file. To override configuration options for repositories, use repoid.option for the <option>. Values for configuration options like excludepkgs, includepkgs, installonlypkgs and tsflags are appended to the original value, they do not override it. However, specifying an empty value (e.g. --setopt=tsflags=) will clear the option.

--skip-broken Resolve depsolve problems by removing packages that are causing problems from the transaction. It is an alias for the strict configuration option with value False. Additionally, with the enable and disable module subcommands it allows one to perform an action even in case of broken modular dependencies.

--showduplicates Show duplicate packages in repositories. Applicable for the list and search commands.

-v, --verbose Verbose operation, show debug messages.

--version Show DNF version and exit.

-y, --assumeyes Automatically answer yes for all questions.

List options are comma-separated. Command-line options override respective settings from configuration files.

## 2.4 Commands

For an explanation of <package-spec>, <package-file-spec> and <package-name-spec> see Specifying Packages.

For an explanation of <provide-spec> see Specifying Provides.

For an explanation of <group-spec> see Specifying Groups.

For an explanation of <module-spec> see Specifying Modules.

For an explanation of <transaction-spec> see Specifying Transactions.

### 2.4.1 Alias Command

Command: alias

Allows the user to define and manage a list of aliases (in the form <name=value>), which can be then used as dnf commands to abbreviate longer command sequences. For examples on using the alias command, see Alias Examples. For examples on the alias processing, see Alias Processing Examples.

To use an alias (name=value), the name must be placed as the first “command” (e.g. the first argument that is not an option). It is then replaced by its value and the resulting sequence is again searched for aliases. The alias processing stops when the first found command is not a name of any alias.

In case the processing would result in an infinite recursion, the original arguments are used instead.
Also, like in shell aliases, if the result starts with a \, the alias processing will stop.

All aliases are defined in configuration files in the /etc/dnf/aliases.d/ directory in the [aliases] section, and aliases created by the alias command are written to the USER.conf file. In case of conflicts, the USER.conf has the highest priority, and alphabetical ordering is used for the rest of the configuration files.

Optionally, there is the enabled option in the [main] section defaulting to True. This can be set for each file separately in the respective file, or globally for all aliases in the ALIASES.conf file.

```bash
dnf alias [options] [list] [<name>...]
```

List aliases with their final result. The [<alias>...] parameter further limits the result to only those aliases matching it.

```bash
dnf alias [options] add <name=value>...
```

Create new aliases.

```bash
dnf alias [options] delete <name>...
```

Delete aliases.

**Alias Examples**

```bash
dnf alias list  Lists all defined aliases.
dnf alias add rm=remove  Adds a new command alias called rm which works the same as the remove command.
dnf alias add upgrade="\upgrade --skip-broken --disableexcludes=all --obsoletes"  Adds a new command alias called upgrade which works the same as the upgrade command, with additional options. Note that the original upgrade command is prefixed with a \ to prevent an infinite loop in alias processing.
```

**Alias Processing Examples**

If there are defined aliases **in=install** and **FORCE="--skip-broken --disableexcludes=all"**:  
- dnf FORCE in will be replaced with dnf --skip-broken --disableexcludes=all install  
- dnf in FORCE will be replaced with dnf install FORCE (which will fail)

If there is defined alias **in=install**:  
- dnf in will be replaced with dnf install  
- dnf --repo updates in will be replaced with dnf --repo updates in (which will fail)

**2.4.2 Autoremove Command**

Command: autoremove  
Aliases for **explicit NEVRA matching**: autoremove-n, autoremove-na, autoremove-nevra

```bash
dnf [options] autoremove
```

Removes all “leaf” packages from the system that were originally installed as dependencies of user-installed packages, but which are no longer required by any such package.
Packages listed in `installonlypkgs` are never automatically removed by this command.

```bash
dnf [options] autoremove <spec>...
```

This is an alias for the `Remove Command` command with `clean_requirements_on_remove` set to `True`. It removes the specified packages from the system along with any packages depending on the packages being removed. Each `<spec>` can be either a `<package-spec>`, which specifies a package directly, or a `<@<group-spec>`, which specifies an (environment) group which contains it. It also removes any dependencies that are no longer needed.

There are also a few specific autoremove commands `autoremove-n`, `autoremove-na` and `autoremove-nevra` that allow the specification of an exact argument in the NEVRA (name-epoch:version-release.architecture) format.

This command by default does not force a sync of expired metadata. See also `Metadata Synchronization`.

### 2.4.3 Check Command

**Command:** `check`

```bash
```

Checks the local packagedb and produces information on any problems it finds. You can limit the checks to be performed by using the `--dependencies`, `--duplicates`, `--obsoleted` and `--provides` options (the default is to check everything).

### 2.4.4 Check-Update Command

**Command:** `check-update`

**Aliases:** `check-upgrade`

```bash
dnf [options] check-update [--changelogs] [<package-file-spec>...]
```

Non-interactively checks if updates of the specified packages are available. If no `<package-file-spec>` is given, checks whether any updates at all are available for your system. DNF exit code will be 100 when there are updates available and a list of the updates will be printed, 0 if not and 1 if an error occurs. If `--changelogs` option is specified, also changelog delta of packages about to be updated is printed.

Please note that having a specific newer version available for an installed package (and reported by `check-update`) does not imply that subsequent `dnf upgrade` will install it. The difference is that `dnf upgrade` has restrictions (like package dependencies being satisfied) to take into account.

The output is affected by the `autocheck_running_kernel` configuration option.

### 2.4.5 Clean Command

**Command:** `clean`

Performs cleanup of temporary files kept for repositories. This includes any such data left behind from disabled or removed repositories as well as for different distribution release versions.
**2.4.6 Deplist Command**

`dnf [options] deplist [select-options] [query-options] [package-spec]`  
Deprecated alias for `dnf repoquery --deplist`.

**2.4.7 Distro-Sync Command**

Command: `distro-sync`  
Aliases: `dsync`  
Deprecated aliases: `distrosync`, `distribution-synchronization`  

`dnf distro-sync [package-spec...]` As necessary upgrades, downgrades or keeps selected installed packages to match the latest version available from any enabled repository. If no package is given, all installed packages are considered.  
See also *Configuration Files Replacement Policy*.

**2.4.8 Downgrade Command**

Command: `downgrade`  
Aliases: `dg`  

`dnf [options] downgrade <package-spec>...` Downgrades the specified packages to the highest installable package of all known lower versions if possible. When version is given and is lower than version of installed package then it downgrades to target version.

**2.4.9 Group Command**

Command: `group`  
Aliases: `grp`  
Deprecated aliases: `groups`, `grouplist`, `groupinstall`, `groupremove`, `grouperase`, `groupinfo`  

Groups are virtual collections of packages. DNF keeps track of groups that the user selected (“marked”) installed and can manipulate the comprising packages with simple commands.
**dnf Documentation, Release stable**

`dnf [options] group [summary] <group-spec>` Display overview of how many groups are installed and available. With a spec, limit the output to the matching groups. `summary` is the default groups subcommand.

`dnf [options] group info <group-spec>` Display package lists of a group. Shows which packages are installed or available from a repository when `--v` is used.

`dnf [options] group install [--with-optional] <group-spec>...` Mark the specified group installed and install packages it contains. Also include optional packages of the group if `--with-optional` is specified. All `mandatory` and `Default` packages will be installed whenever possible. Conditional packages are installed if they meet their requirement. If the group is already (partially) installed, the command installs the missing packages from the group. Depending on the value of `obsoletes configuration option` group installation takes obsoletes into account.

`dnf [options] group list <group-spec>...` List all matching groups, either among installed or available groups. If nothing is specified, list all known groups. `--installed` and `--available` options narrow down the requested list. Records are ordered by the `display_order` tag defined in comps.xml file. Provides a list of all hidden groups by using option `--hidden`. Provides group IDs when the `--v` or `--ids` options are used.

`dnf [options] group remove <group-spec>...` Mark the group removed and remove those packages in the group from the system which do not belong to another installed group and were not installed explicitly by the user.

`dnf [options] group upgrade <group-spec>...` Upgrades the packages from the group and upgrades the group itself. The latter comprises of installing packages that were added to the group by the distribution and removing packages that got removed from the group as far as they were not installed explicitly by the user.

Groups can also be marked installed or removed without physically manipulating any packages:

`dnf [options] group mark install <group-spec>...` Mark the specified group installed. No packages will be installed by this command, but the group is then considered installed.

`dnf [options] group mark remove <group-spec>...` Mark the specified group removed. No packages will be removed by this command.

See also `Configuration Files Replacement Policy`.

### 2.4.10 Help Command

Command: `help`

`dnf help [command]` Displays the help text for all commands. If given a command name then only displays help for that particular command.

### 2.4.11 History Command

Command: `history`

Aliases: `hist`

The history command allows the user to view what has happened in past transactions and act according to this information (assuming the `history_record` configuration option is set).

`dnf history [list] [--reverse] [spec...]` The default history action is listing information about given transactions in a table. Each `spec` can be either a `transaction-spec`, which specifies a transaction directly, or a `transaction-spec..<transaction-spec>`, which specifies a range of trans-
actions, or a `<package-name-spec>`, which specifies a transaction by a package which it manipulated. When no transaction is specified, list all known transactions.

`--reverse` The order of `history list` output is printed in reverse order.

dnf history info [spec...] Describe the given transactions. The meaning of `spec` is the same as in the `History List Command`. When no transaction is specified, describe what happened during the latest transaction.

dnf history redo `<transaction-spec>`|<package-file-spec> Repeat the specified transaction. Uses the last transaction (with the highest ID) if more than one transaction for given `<package-file-spec>` is found. If it is not possible to redo some operations due to the current state of RPMDB, it will not redo the transaction.

dnf history replay [--ignore-installed] [--ignore-extras] [--skip-unavailable] <filename> Replay a transaction stored in file `<filename>` by `History Store Command`. The replay will perform the exact same operations on the packages as in the original transaction and will return with an error if case of any differences in installed packages or their versions. See also the `Transaction JSON Format specification` of the file format.

`--ignore-installed` Don’t check for the installed packages being in the same state as those recorded in the transaction. E.g. in case there is an upgrade `foo-1.0` -> `foo-2.0` stored in the transaction, but there is `foo-1.1` installed on the target system.

`--ignore-extras` Don’t check for extra packages pulled into the transaction on the target system. E.g. the target system may not have some dependency, which was installed on the source system. The replay errors out on this by default, as the transaction would not be the same.

`--skip-unavailable` In case some packages stored in the transaction are not available on the target system, skip them instead of erroring out.

dnf history rollback `<transaction-spec>`|<package-file-spec> Undo all transactions performed after the specified transaction. Uses the last transaction (with the highest ID) if more than one transaction for given `<package-file-spec>` is found. If it is not possible to undo some transactions due to the current state of RPMDB, it will not undo any transaction.

dnf history store [--output <output-file>] `<transaction-spec>` Store a transaction specified by `<transaction-spec>`. The transaction can later be replayed by the `History Store Command`.

Warning: The stored transaction format is considered unstable and may change at any time. It will work if the same version of dnf is used to store and replay (or between versions as long as it stays the same).

-o <output-file>, --output=<output-file> Store the serialized transaction into `<output-file`. Default is `transaction.json`.

dnf history undo `<transaction-spec>`|<package-file-spec> Perform the opposite operation to all operations performed in the specified transaction. Uses the last transaction (with the highest ID) if more than one transaction for given `<package-file-spec>` is found. If it is not possible to undo some operations due to the current state of RPMDB, it will not undo the transaction.

dnf history userinstalled Show all installonly packages, packages installed outside of DNF and packages not installed as dependency. I.e. it lists packages that will stay on the system when `Autoremove Command` or `Remove Command` along with `clean_requirements_on_remove` configuration option set to True is executed. Note the same results can be accomplished with `dnf repoquery --userinstalled`, and the repoquery command is more powerful in formatting of the output.

This command by default does not force a sync of expired metadata, except for the redo, rollback, and undo subcommands. See also `Metadata Synchronization` and `Configuration Files Replacement Policy`. 

2.4. Commands 21
2.4.12 Info Command

Command: info
Aliases: if

The info command limits the displayed packages the same way as the list command.
This command by default does not force a sync of expired metadata. See also Metadata Synchronization.

2.4.13 Install Command

Command: install
Aliases: in
Aliases for explicit NEVRA matching: install-n, install-na, install-nevra
Deprecated aliases: localinstall

dnf [options] install <spec>... Makes sure that the given packages and their dependencies are installed on the system. Each <spec> can be either a <package-spec>, or a @<module-spec>, or a @<group-spec>. See Install Examples. If a given package or provide cannot be (and is not already) installed, the exit code will be non-zero. If the <spec> matches both a @<module-spec> and a @<group-spec>, only the module is installed.

When <package-spec> to specify the exact version of the package is given, DNF will install the desired version, no matter which version of the package is already installed. The former version of the package will be removed in the case of non-installonly package.

On the other hand if <package-spec> specifies only a name, DNF also takes into account packages obsoleting it when picking which package to install. This behaviour is specific to the install command. Note that this can lead to seemingly unexpected results if a package has multiple versions and some older version is being obsoleted. It creates a split in the upgrade-path and both ways are considered correct, the resulting package is picked simply by lexicographical order.

There are also a few specific install commands install-n, install-na and install-nevra that allow the specification of an exact argument in the NEVRA format.

See also Configuration Files Replacement Policy.

Install Examples

dnf install tito Install the tito package (tito is the package name).

dnf install ~/Downloads/tito-0.6.2-1.fc22.noarch.rpm Install a local rpm file tito-0.6.2-1.fc22.noarch.rpm from the ~/Downloads/ directory.

dnf install tito-0.5.6-1.fc22 Install the package with a specific version. If the package is already installed it will automatically try to downgrade or upgrade to the specific version.

dnf --best install tito Install the latest available version of the package. If the package is already installed it will try to automatically upgrade to the latest version. If the latest version of the package cannot be installed, the installation will fail.
**dnf install vim**  DNF will automatically recognize that vim is not a package name, but will look up and install a package that provides vim with all the required dependencies. Note: Package name match has precedence over package provides match.

**dnf install https://kojipkgs.fedoraproject.org//packages/tito/0.6.0/1.fc22/noarch/tito-0.6.0-1.fc22.noarch.rpm**  Install a package directly from a URL.

**dnf install '@docker'**  Install all default profiles of module ‘docker’ and their RPMs. Module streams get enabled accordingly.

**dnf install '@Web Server'**  Install the ‘Web Server’ environmental group.

**dnf install /usr/bin/rpmsign**  Install a package that provides the /usr/bin/rpmsign file.

**dnf --y install tito --setopt=install_weakdeps=False**  Install the tito package (tito is the package name) without weak deps. Weak deps are not required for core functionality of the package, but they enhance the original package (like extended documentation, plugins, additional functions, etc.).

**dnf install --advisory=FEDORA-2018-b7b99fe852 \***  Install all packages that belong to the “FEDORA-2018-b7b99fe852” advisory.

### 2.4.14 List Command

Command: list  
Aliases: ls

Prints lists of packages depending on the packages’ relation to the system. A package is installed if it is present in the RPMDB, and it is available if it is not installed but is present in a repository that DNF knows about.

The list command also limits the displayed packages according to specific criteria, e.g. to only those that update an installed package (respecting the repository priority). The exclude option in the configuration file can influence the result, but if the --disableexcludes command line option is used, it ensures that all installed packages will be listed.

**dnf [options] list [--all] [<package-file-spec>...]**  Lists all packages, present in the RPMDB, in a repository or both.

**dnf [options] list --installed [<package-file-spec>...]**  Lists installed packages.

**dnf [options] list --available [<package-file-spec>...]**  Lists available packages.

**dnf [options] list --extras [<package-file-spec>...]**  Lists extras, that is packages installed on the system that are not available in any known repository.

**dnf [options] list --obsoletes [<package-file-spec>...]**  List packages installed on the system that are obsoleted by packages in any known repository.

**dnf [options] list --recent [<package-file-spec>...]**  List packages recently added into the repositories.

**dnf [options] list --upgrades [<package-file-spec>...]**  List upgrades available for the installed packages.

**dnf [options] list --autoremove**  List packages which will be removed by the dnf autoremove command.

This command by default does not force a sync of expired metadata. See also Metadata Synchronization.
## 2.4.15 Makecache Command

Command: `makecache`

Aliases: `mc`

`dnf [options] makecache` Downloads and caches metadata for enabled repositories. Tries to avoid downloading whenever possible (e.g. when the local metadata hasn’t expired yet or when the metadata timestamp hasn’t changed).

`dnf [options] makecache --timer` Like plain `makecache`, but instructs DNF to be more resource-aware, meaning it will not do anything if running on battery power and will terminate immediately if it’s too soon after the last successful `makecache` run (see `dnf.conf(5)`, `metadata_timer_sync`).

## 2.4.16 Mark Command

Command: `mark`

`dnf mark install <package-spec>...` Marks the specified packages as installed by user. This can be useful if any package was installed as a dependency and is desired to stay on the system when `Autoremove Command` or `Remove Command` along with `clean_requirements_on_remove` configuration option set to `True` is executed.

`dnf mark remove <package-spec>...` Unmarks the specified packages as installed by user. Whenever you as a user don’t need a specific package you can mark it for removal. The package stays installed on the system but will be removed when `Autoremove Command` or `Remove Command` along with `clean_requirements_on_remove` configuration option set to `True` is executed. You should use this operation instead of `Remove Command` if you’re not sure whether the package is a requirement of other user installed packages on the system.

`dnf mark group <package-spec>...` Marks the specified packages as installed by group. This can be useful if any package was installed as a dependency or a user and is desired to be protected and handled as a group member like during group remove.

## 2.4.17 Module Command

Command: `module`

Modularity overview is available at `man page dnf.modularity(7)`. Module subcommands take `<module-spec>...` arguments that specify modules or profiles.

`dnf [options] module install <module-spec>...` Install module profiles, including their packages. In case no profile was provided, all default profiles get installed. Module streams get enabled accordingly.

This command cannot be used for switching module streams. Use the `dnf module switch-to` command for that.

`dnf [options] module update <module-spec>...` Update packages associated with an active module stream, optionally restricted to a profile. If the `profile_name` is provided, only the packages referenced by that profile will be updated.

`dnf [options] module switch-to <module-spec>...` Switch to or enable a module stream, change versions of installed packages to versions provided by the new stream, and remove packages from the old stream that are no longer available. It also updates installed profiles if they are available for the new stream. When a profile was provided, it installs that profile and does not update any already installed profiles.
This command can be used as a stronger version of the `dnf module enable` command, which not only enables modules, but also does a `distrosync` to all modular packages in the enabled modules.

It can also be used as a stronger version of the `dnf module install` command, but it requires to specify profiles that are supposed to be installed, because `switch-to` command does not use default profiles. The `switch-to` command doesn’t only install profiles, it also makes a `distrosync` to all modular packages in the installed module.

```
dnf [options] module remove <module-spec>... Remove installed module profiles, including packages that were installed with the dnf module install command. Will not remove packages required by other installed module profiles or by other user-installed packages. In case no profile was provided, all installed profiles get removed.
```

```
dnf [options] module remove --all <module-spec>... Remove installed module profiles, including packages that were installed with the dnf module install command. With --all option it additionally removes all packages whose names are provided by specified modules. Packages required by other installed module profiles and packages whose names are also provided by any other module are not removed.
```

```
dnf [options] module enable <module-spec>... Enable a module stream and make the stream RPMs available in the package set.

Modular dependencies are resolved, dependencies checked and also recursively enabled. In case of modular dependency issue the operation will be rejected. To perform the action anyway please use --skip-broken option.

This command cannot be used for switching module streams. Use the dnf module switch-to command for that.
```

```
dnf [options] module disable <module-name>... Disable a module. All related module streams will become unavailable. Consequently, all installed profiles will be removed and the module RPMs will become unavailable in the package set. In case of modular dependency issue the operation will be rejected. To perform the action anyway please use --skip-broken option.
```

```
dnf [options] module reset <module-name>... Reset module state so it's no longer enabled or disabled. Consequently, all installed profiles will be removed and only RPMs from the default stream will be available in the package set.
```

```
dnf [options] module provides <package-name-spec>... Lists all modular packages matching <package-name-spec> from all modules (including disabled), along with the modules and streams they belong to.
```

```
dnf [options] module list [--all] [module_name...] Lists all module streams, their profiles and states (enabled, disabled, default).
```

```
dnf [options] module list --enabled [module_name...] Lists module streams that are enabled.
```

```
dnf [options] module list --disabled [module_name...] Lists module streams that are disabled.
```

```
dnf [options] module list --installed [module_name...] List module streams with installed profiles.
```

```
dnf [options] module info <module-spec>... Print detailed information about given module stream.
```

```
dnf [options] module info --profile <module-spec>... Print detailed information about given module profiles.
```

```
dnf [options] module repoquery <module-spec>... List all available packages belonging to selected modules.
```

```
dnf [options] module repoquery --available <module-spec>... List all available packages belonging to selected modules.
```

```
dnf [options] module repoquery --installed <module-spec>... List all installed packages with same name like packages belonging to selected modules.
```

2.4. Commands 25
2.4.18 Provides Command

Command: `provides`
Aliases: `prov`, `whatprovides`, `wp`

`dnf [options] provides <provide-spec>` Finds the packages providing the given `<provide-spec>`. This is useful when one knows a filename and wants to find what package (installed or not) provides this file. The `<provide-spec>` is gradually looked for at following locations:

1. The `<provide-spec>` is matched with all file provides of any available package:

   ```
   $ dnf provides /usr/bin/gzip
   gzip-1.9-9.fc29.x86_64 : The GNU data compression program
   Matched from:
   Filename : /usr/bin/gzip
   ```

2. Then all provides of all available packages are searched:

   ```
   $ dnf provides "gzip(x86-64)"
   gzip-1.9-9.fc29.x86_64 : The GNU data compression program
   Matched from:
   Provide : gzip(x86-64) = 1.9-9.fc29
   ```

3. DNF assumes that the `<provide-spec>` is a system command, prepends it with `/usr/bin/`, `/usr/sbin/` prefixes (one at a time) and does the file provides search again. For legacy reasons (packages that didn’t do UsrMove) also `/bin` and `/sbin` prefixes are being searched:

   ```
   $ dnf provides zless
   gzip-1.9-9.fc29.x86_64 : The GNU data compression program
   Matched from:
   Filename : /usr/bin/zless
   ```

4. If this last step also fails, DNF returns “Error: No Matches found”.

This command by default does not force a sync of expired metadata. See also Metadata Synchronization.

2.4.19 Reinstall Command

Command: `reinstall`
Aliases: `rei`

`dnf [options] reinstall <package-spec>...` Installs the specified packages, fails if some of the packages are either not installed or not available (i.e. there is no repository where to download the same RPM).

2.4.20 Remove Command

Command: `remove`
Aliases: `rm`

Aliases for explicit NEVRA matching: `remove-n`, `remove-na`, `remove-nevra`  
Deprecated aliases: `erase`, `erase-n`, `erase-na`, `erase-nevra`

`dnf [options] remove <package-spec>...` Removes the specified packages from the system along with any packages depending on the packages being removed. Each `<spec>` can be either a `<package-spec>`,
which specifies a package directly, or a @<group-spec>, which specifies an (environment) group which contains it. If clean_requirements_on_remove is enabled (the default), also removes any dependencies that are no longer needed.

**dnf [options] remove --duplicates** Removes older versions of duplicate packages. To ensure the integrity of the system it reinstalls the newest package. In some cases the command cannot resolve conflicts. In such cases the *dnf shell* command with remove --duplicates and upgrade dnf-shell sub-commands could help.

**dnf [options] remove --oldinstallonly** Removes old installonly packages, keeping only latest versions and version of running kernel.

There are also a few specific remove commands remove-n, remove-na and remove-nevra that allow the specification of an exact argument in the NEVRA format.

**Remove Examples**

```
dnf remove acpi tito       Remove the acpi and tito packages.
dnf remove $(dnf repoquery --extras --exclude=tito,acpi) Remove packages not present in any repository, but don’t remove the tito and acpi packages (they still might be removed if they depend on some of the removed packages).
```

Remove older versions of duplicated packages (an equivalent of yum’s *package-cleanup –cleandups*):

```
dnf remove --duplicates
```

### 2.4.21 Repoinfo Command

Command: repoinfo

An alias for the *repolist* command that provides more detailed information like *dnf repolist -v*.

### 2.4.22 Repolist Command

Command: repolist

```
dnf [options] repolist [--enabled|--disabled|--all] Depending on the exact command lists enabled, disabled or all known repositories. Lists all enabled repositories by default. Provides more detailed information when -v option is used.
```

This command by default does not force a sync of expired metadata. See also *Metadata Synchronization*.

### 2.4.23 Repoquery Command

Command: repoquery

Aliases: rq

Aliases for *explicit NEVRA matching*: repoquery-n, repoquery-na, repoquery-nevra

```
dnf [options] repoquery [<select-options>] [<query-options>] [<package-file-spec>]
```

Searches available DNF repositories for selected packages and displays the requested information about them. It is an equivalent of *rpm -q* for remote repositories.
### dnf Command Reference

**dnf [options] repoquery --groupmember <package-spec>...** List groups that contain <package-spec>.

**dnf [options] repoquery --querytags** Provides the list of tags recognized by the --queryformat repoquery option.

There are also a few specific repoquery commands repoquery-n, repoquery-na and repoquery-nevra that allow the specification of an exact argument in the NEVRA format (does not affect arguments of options like --whatprovides <arg>, ...).

### Select Options

Together with <package-file-spec>, control what packages are displayed in the output. If <package-file-spec> is given, limits the resulting set of packages to those matching the specification. All packages are considered if no <package-file-spec> is specified.

**<package-file-spec>** Package specification in the NEVRA format (name[-[epoch:]version[-release]][.arch]), a package provide or a file provide. See Specifying Packages.

**-a, --all** Query all packages (for rpmquery compatibility, also a shorthand for repoquery ‘*’ or repoquery without arguments).

**--arch <arch>[,<arch>...], --archlist <arch>[,<arch>...]** Limit the resulting set only to packages of selected architectures (default is all architectures). In some cases the result is affected by the basearch of the running system, therefore to run repoquery for an arch incompatible with your system use the --forcearch=<arch> option to change the basearch.

**--duplicates** Limit the resulting set to installed duplicate packages (i.e. more package versions for the same name and architecture). Installonly packages are excluded from this set.

**--unneeded** Limit the resulting set to leaves packages that were installed as dependencies so they are no longer needed. This switch lists packages that are going to be removed after executing the dnf autoremove command.

**--available** Limit the resulting set to available packages only (set by default).

**--disable-modular-filtering** Disables filtering of modular packages, so that packages of inactive module streams are included in the result.

**--extras** Limit the resulting set to packages that are not present in any of the available repositories.

**-f <file>, --file <file>** Limit the resulting set only to the package that owns <file>.

**--installed** Limit the resulting set to installed packages only. The exclude option in the configuration file might influence the result, but if the command line option --disablenecludes is used, it ensures that all installed packages will be listed.

**--installonly** Limit the resulting set to installed installonly packages.

**--latest-limit <number>** Limit the resulting set to <number> of latest packages for every package name and architecture. If <number> is negative, skip <number> of latest packages. For a negative <number> use the --latest-limit=<number> syntax.

**--recent** Limit the resulting set to packages that were recently edited.

**--repo <repoid>** Limit the resulting set only to packages from a repository identified by <repoid>. Can be used multiple times with accumulative effect.

**--unsatisfied** Report unsatisfied dependencies among installed packages (i.e. missing requires and and existing conflicts).

**--upgrades** Limit the resulting set to packages that provide an upgrade for some already installed package.
--userinstalled  Limit the resulting set to packages installed by the user. The exclude option in the configuration file might influence the result, but if the command line option --disableexclude is used, it ensures that all installed packages will be listed.

--whatdepends <capability>[,<capability>...]  Limit the resulting set only to packages that require, enhance, recommend, suggest or supplement any of <capabilities>.

--whatconflicts <capability>[,<capability>...]  Limit the resulting set only to packages that conflict with any of <capabilities>.

--whatenhances <capability>[,<capability>...]  Limit the resulting set only to packages that enhance any of <capabilities>. Use --whatdepends if you want to list all depending packages.

--whatobsoletes <capability>[,<capability>...]  Limit the resulting set only to packages that obsolete any of <capabilities>.

--whatprovides <capability>[,<capability>...]  Limit the resulting set only to packages that provide any of <capabilities>.

--whatrecommends <capability>[,<capability>...]  Limit the resulting set only to packages that recommend any of <capabilities>. Use --whatdepends if you want to list all depending packages.

--whatrequires <capability>[,<capability>...]  Limit the resulting set only to packages that require any of <capabilities>. Use --whatdepends if you want to list all depending packages.

--whatsuggests <capability>[,<capability>...]  Limit the resulting set only to packages that suggest any of <capabilities>. Use --whatdepends if you want to list all depending packages.

--whatsupplements <capability>[,<capability>...]  Limit the resulting set only to packages that supplement any of <capabilities>. Use --whatdepends if you want to list all depending packages.

--alldeps  This option is stackable with --whatrequires or --whatdepends only. Additionally it adds all packages requiring the package features to the result set (used as default).

--exactdeps  This option is stackable with --whatrequires or --whatdepends only. Limit the resulting set only to packages that require <capability> specified by --whatrequires.

--srpm  Operate on the corresponding source RPM.

Query Options

Set what information is displayed about each package.

The following are mutually exclusive, i.e. at most one can be specified. If no query option is given, matching packages are displayed in the standard NEVRA notation.

-i, --info  Show detailed information about the package.
-l, --list  Show the list of files in the package.
-s, --source  Show the package source RPM name.
--changelogs  Print the package changelogs.
--conflicts  Display capabilities that the package conflicts with. Same as --qf "%{conflicts}".
--depends  Display capabilities that the package depends on, enhances, recommends, suggests or supplements.
--enhances  Display capabilities enhanced by the package. Same as --qf "%{enhances}".
--location  Show a location where the package could be downloaded from.
--obsoletes  Display capabilities that the package obsoletes. Same as --qf "%{obsoletes}".
--provides  Display capabilities provided by the package. Same as --qf "%{provides}".
--recommends Display capabilities recommended by the package. Same as --qf "%{recommends}".

--requires Display capabilities that the package depends on. Same as --qf "%{requires}".

--requires-pre Display capabilities that the package depends on for running a %pre script. Same as --qf "%{requires-pre}".

--suggests Display capabilities suggested by the package. Same as --qf "%{suggests}".

--supplements Display capabilities supplemented by the package. Same as --qf "%{supplements}".

--tree Display a recursive tree of packages with capabilities specified by one of the following supplementary options: --whatrequires, --requires, --conflicts, --enhances, --suggests, --provides, --supplements, --recommends.

--deplist Produce a list of all direct dependencies and what packages provide those dependencies for the given packages. The result only shows the newest providers (which can be changed by using --verbose).

--nvr Show found packages in the name-version-release format. Same as --qf "%{name}-%{version}-%{release}".

--nevra Show found packages in the name-epoch:version-release.architecture format. Same as --qf "%{name}-%{epoch}:%{version}-%{release}.%{arch}" (default).

--envera Show found packages in the epoch:name-version-release.architecture format. Same as --qf "%{epoch}:%{name}-%{version}-%{release}.%{arch}"

--qf <format>, --queryformat <format> Custom display format. <format> is the string to output for each matched package. Every occurrence of %{<tag>} within is replaced by the corresponding attribute of the package. The list of recognized tags can be displayed by running dnf repoquery --querytags.

--recursive Query packages recursively. Has to be used with --whatrequires <REQ> (optionally with --alldeps, but not with --exactdeps) or with --requires <REQ> --resolve.

--resolve resolve capabilities to originating package(s).

Examples

Display NEVRAs of all available packages matching light*:

```
dnf repoquery 'light*'  
```

Display NEVRAs of all available packages matching name light* and architecture noarch (accepts only arguments in the "<name>..<archs>" format):

```
dnf repoquery-na 'light*.noarch'  
```

Display requires of all lighttpd packages:

```
dnf repoquery --requires lighttpd  
```

Display packages providing the requires of python packages:

```
dnf repoquery --requires python --resolve  
```

Display source rpm of ligttpd package:

```
dnf repoquery --source lighttpd  
```

Display package name that owns the given file:
Display name, architecture and the containing repository of all lighttpd packages:

dnf repoquery --queryformat '%{name}.%{arch}: %{reponame}' lighttpd

Display all available packages providing “webserver”:

dnf repoquery --whatprovides webserver

Display all available packages providing “webserver” but only for “i686” architecture:

dnf repoquery --whatprovides webserver --arch i686

Display duplicate packages:

dnf repoquery --duplicates

Display source packages that require a <provide> for a build:

dnf repoquery --disablerepo="*" --enablerepo="*-source" --arch=src --whatrequires <provide>

### 2.4.24 Repository-Packages Command

**Command:** repository-packages

**Deprecated aliases:** repo-pkgs, repo-packages, repository-pkgs

The repository-packages command allows the user to run commands on top of all packages in the repository named `<repoid>`. However, any dependency resolution takes into account packages from all enabled repositories. The `<package-file-spec>` and `<package-spec>` specifications further limit the candidates to only those packages matching at least one of them.

The `info` subcommand lists description and summary information about packages depending on the packages’ relation to the repository. The `list` subcommand just prints lists of those packages.

```bash
dnf [options] repository-packages <repoid> check-update [<package-file-spec>...]
```

Non-interactively checks if updates of the specified packages in the repository are available. DNF exit code will be 100 when there are updates available and a list of the updates will be printed.

```bash
dnf [options] repository-packages <repoid> info [--all] [<package-file-spec>...]
```

List all related packages.

```bash
dnf [options] repository-packages <repoid> info --installed [<package-file-spec>...]
```

List packages installed from the repository.

```bash
dnf [options] repository-packages <repoid> info --available [<package-file-spec>...]
```

List packages available in the repository but not currently installed on the system.

```bash
dnf [options] repository-packages <repoid> info --extras [<package-file-specs>...]
```

List packages installed from the repository that are not available in any repository.

```bash
dnf [options] repository-packages <repoid> info --obsoletes [<package-file-spec>...]
```

List packages in the repository that obsolete packages installed on the system.

```bash
dnf [options] repository-packages <repoid> info --recent [<package-file-spec>...]
```

List packages recently added into the repository.

2.4. Commands
dnf [options] repository-packages <repoid> info --upgrades [<package-file-spec>...] List packages in the repository that upgrade packages installed on the system.

dnf [options] repository-packages <repoid> install [<package-spec>...] Install packages matching <package-spec> from the repository. If <package-spec> isn’t specified at all, install all packages from the repository.

dnf [options] repository-packages <repoid> list [--all] [<package-file-spec>...] List all related packages.

dnf [options] repository-packages <repoid> list --installed [<package-file-spec>...] List packages installed from the repository.

dnf [options] repository-packages <repoid> list --available [<package-file-spec>...] List packages available in the repository but not currently installed on the system.

dnf [options] repository-packages <repoid> list --extras [<package-file-spec>...] List packages installed from the repository that are not available in any repository.

dnf [options] repository-packages <repoid> list --obsoletes [<package-file-spec>...] List packages in the repository that obsolete packages installed on the system.

dnf [options] repository-packages <repoid> list --recent [<package-file-spec>...] List packages recently added into the repository.

dnf [options] repository-packages <repoid> list --upgrades [<package-file-spec>...] List packages in the repository that upgrade packages installed on the system.

dnf [options] repository-packages <repoid> move-to [<package-spec>...] Reinstall all those packages that are available in the repository.

dnf [options] repository-packages <repoid> reinstall [<package-spec>...] Run the reinstall-old subcommand. If it fails, run the move-to subcommand.

dnf [options] repository-packages <repoid> reinstall-old [<package-spec>...] Reinstall all those packages that were installed from the repository and simultaneously are available in the repository.

dnf [options] repository-packages <repoid> remove [<package-spec>...] Remove all packages installed from the repository along with any packages depending on the packages being removed. If clean_requirements_on_remove is enabled (the default) also removes any dependencies that are no longer needed.

dnf [options] repository-packages <repoid> remove-or-distro-sync [<package-spec>...] Select all packages installed from the repository. Upgrade, downgrade or keep those of them that are available in another repository to match the latest version available there and remove the others along with any packages depending on the packages being removed. If clean_requirements_on_remove is enabled (the default) also removes any dependencies that are no longer needed.

dnf [options] repository-packages <repoid> remove-or-reinstall [<package-spec>...] Select all packages installed from the repository. Reinstall those of them that are available in another repository and remove the others along with any packages depending on the packages being removed. If clean_requirements_on_remove is enabled (the default) also removes any dependencies that are no longer needed.

dnf [options] repository-packages <repoid> upgrade [<package-spec>...] Update all packages to the highest resolvable version available in the repository. When versions are specified in the <package-spec>, update to these versions.

dnf [options] repository-packages <repoid> upgrade-to [<package-specs>...] A deprecated alias for the upgrade subcommand.
2.4.25 Search Command

Command: search
Aliases: se

dnf [options] search [--all] <keywords>... Search package metadata for keywords. Keywords are matched as case-insensitive substrings, gloving is supported. By default lists packages that match all requested keys (AND operation). Keys are searched in package names and summaries. If the “--all” option is used, lists packages that match at least one of the keys (an OR operation). In addition the keys are searched in the package descriptions and URLs. The result is sorted from the most relevant results to the least.

This command by default does not force a sync of expired metadata. See also Metadata Synchronization.

2.4.26 Shell Command

Command: shell
Aliases: sh

dnf [options] shell [filename] Open an interactive shell for conducting multiple commands during a single execution of DNF. These commands can be issued manually or passed to DNF from a file. The commands are much the same as the normal DNF command line options. There are a few additional commands documented below.

config [conf-option] [value]
  • Set a configuration option to a requested value. If no value is given it prints the current value.

repo [list|enable|disable] [repo-id]
  • list: list repositories and their status
  • enable: enable repository
  • disable: disable repository

transaction [list|reset|solve|run]
  • list: resolve and list the content of the transaction
  • reset: reset the transaction
  • run: resolve and run the transaction

Note that all local packages must be used in the first shell transaction subcommand (e.g. install /tmp/nodejs-1-1.x86_64.rpm /tmp/acpi-1-1.noarch.rpm) otherwise an error will occur. Any disable, enable, and reset module operations (e.g. module enable nodejs) must also be performed before any other shell transaction subcommand is used.

2.4.27 Swap Command

Command: swap

dnf [options] swap <remove-spec> <install-spec>
Remove spec and install spec in one transaction. Each `<spec>` can be either a `<package-spec>`, which specifies a package directly, or a `<group-spec>`, which specifies an (environment) group which contains it. Automatic conflict solving is provided in DNF by the –allowreplacing option that provides the functionality of the swap command automatically.

### 2.4.28 Updateinfo Command

**Command:** updateinfo  
**Aliases:** upf  
**Deprecated aliases:** list-updateinfo, list-security, list-sec, info-updateinfo, info-security, info-sec, summary-updateinfo

```bash
dnf [options] updateinfo [--summary|--list|--info] [availability] [spec...]
```

Display information about update advisories. Depending on the output type, DNF displays just counts of advisory types (omitted or --summary), list of advisories (--list) or detailed information (--info). The -v option extends the output. When used with --info, the information is even more detailed. When used with --list, an additional column with date of the last advisory update is added.

`<availability>` specifies whether advisories about newer versions of installed packages (omitted or --available), advisories about equal and older versions of installed packages (--installed), advisories about newer versions of those installed packages for which a newer version is available (--updates) or advisories about any versions of installed packages (--all) are taken into account. Most of the time, --available and --updates displays the same output. The outputs differ only in the cases when an advisory refers to a newer version but there is no enabled repository which contains any newer version.

Note, that --available takes only the latest installed versions of packages into account. In case of the kernel packages (when multiple version could be installed simultaneously) also packages of the currently running version of kernel are added.

To print only advisories referencing a CVE or a bugzilla use --with-cve or --with-bz options. When these switches are used also the output of the --list is altered - the ID of the CVE or the bugzilla is printed instead of the one of the advisory.

If given and if neither ID, type (bugfix, enhancement, security/sec) nor a package name of an advisory matches `<spec>`, the advisory is not taken into account. The matching is case-sensitive and in the case of advisory IDs and package names, globbing is supported.

Output of the --summary option is affected by the `autocheck_running_kernel` configuration option.

### 2.4.29 Upgrade Command

**Command:** upgrade  
**Aliases:** up  
**Deprecated aliases:** update, upgrade-to, update-to, localupdate

```bash
dnf [options] upgrade [package-spec]...  
dnf [options] upgrade [package-spec]...  
dnf [options] update @<spec>...  
```

Updates each package to the latest version that is both available and resolvable. Updates each specified package to the latest available version. Updates dependencies as necessary. When versions are specified in the `<package-spec>`, update to these versions.

Alias for the `dnf module update` command.
If the main `obsoletes` configure option is true or the `--obsoletes` flag is present, `dnf` will include package obsoletes in its calculations. For more information see `obsoletes`.

See also `Configuration Files Replacement Policy`.

### 2.4.30 Upgrade-Minimal Command

**Command:** `upgrade-minimal`  
**Aliases:** `up-min`  
**Deprecated aliases:** `update-minimal`

```
dnf [options] upgrade-minimal [options] update-minimal <package-spec>...  
```

Updates each specified package to the latest available version that provides a bugfix, enhancement or a fix for a security issue (security). Updates dependencies as necessary.

### 2.5 Specifying Packages

Many commands take a `<package-spec>` parameter that selects a package for the operation. The `<package-spec>` argument is matched against package NEVRAs, provides and file provides.

- `<package-file-spec>` is similar to `<package-spec>`, except provides matching is not performed. Therefore, `<package-file-spec>` is matched only against NEVRAs and file provides.
- `<package-name-spec>` is matched against NEVRAs only.

#### 2.5.1 Globs

Package specification supports the same glob pattern matching that shell does, in all three above mentioned packages it matches against (NEVRAs, provides and file provides).

The following patterns are supported:

- `*` Matches any number of characters.
- `?` Matches any single character.
- `[]` Matches any one of the enclosed characters. A pair of characters separated by a hyphen denotes a range expression; any character that falls between those two characters, inclusive, is matched. If the first character following the `!` is a `!` or a `^` then any character not enclosed is matched.

Note: Curly brackets (`{}`) are not supported. You can still use them in shells that support them and let the shell do the expansion, but if quoted or escaped, `dnf` will not expand them.

#### 2.5.2 NEVRA Matching

When matching against NEVRAs, partial matching is supported. DNF tries to match the spec against the following list of NEVRA forms (in decreasing order of priority):

- `name-[epoch:]version-release.arch`
- `name.arch`
• name
• name-[epoch:]version-release
• name-[epoch:]version

Note that name can in general contain dashes (e.g. package-with-dashes).

The first form that matches any packages is used and the remaining forms are not tried. If none of the forms match any packages, an attempt is made to match the <package-spec> against full package NEVRAs. This is only relevant if globs are present in the <package-spec>.

<package-spec> matches NEVRAs the same way <package-name-spec> does, but in case matching NEVRAs fails, it attempts to match against provides and file provides of packages as well.

You can specify globs as part of any of the five NEVRA components. You can also specify a glob pattern to match over multiple NEVRA components (in other words, to match across the NEVRA separators). In that case, however, you need to write the spec to match against full package NEVRAs, as it is not possible to split such spec into NEVRA forms.

Specifying NEVRA Matching Explicitly

Some commands (autoremove, install, remove and repoquery) also have aliases with suffixes -n, -na and -nevra that allow to explicitly specify how to parse the arguments:

• Command install-n only matches against name.
• Command install-na only matches against name.arch.
• Command install-nevra only matches against name-[epoch:]version-release.arch.

2.6 Specifying Provides

<provide-spec> in command descriptions means the command operates on packages providing the given spec. This can either be an explicit provide, an implicit provide (i.e. name of the package) or a file provide. The selection is case-sensitive and globbing is supported.

2.6.1 Specifying File Provides

If a spec starts with either / or */., it is considered as a potential file provide.

2.7 Specifying Groups

<group-spec> allows one to select (environment) groups a particular operation should work on. It is a case insensitive string (supporting globbing characters) that is matched against a group’s ID, canonical name and name translated into the current LC_MESSAGES locale (if possible).

2.8 Specifying Modules

<module-spec> allows one to select modules or profiles a particular operation should work on.

It is in the form of NAME:STREAM:VERSION:CONTEXT:ARCH/PROFILE and supported partial forms are the following:
In case stream is not specified, the enabled or the default stream is used, in this order. In case profile is not specified, the system default profile or the ‘default’ profile is used.

2.9 Specifying Transactions

<transaction-spec> can be in one of several forms. If it is an integer, it specifies a transaction ID. Specifying last is the same as specifying the ID of the most recent transaction. The last form is last-<offset>, where <offset> is a positive integer. It specifies offset-th transaction preceding the most recent transaction.

2.10 Package Filtering

Package filtering filters packages out from the available package set, making them invisible to most of dnf commands. They cannot be used in a transaction. Packages can be filtered out by either Exclude Filtering or Modular Filtering.

2.10.1 Exclude Filtering

Exclude Filtering is a mechanism used by a user or by a DNF plugin to modify the set of available packages. Exclude Filtering can be modified by either includepkgs or excludepkgs configuration options in configuration files. The --disableexcludes command line option can be used to override excludes from configuration files. In addition to user-configured excludes, plugins can also extend the set of excluded packages. To disable excludes from a DNF plugin you can use the --disableplugin command line option.

To disable all excludes for e.g. the install command you can use the following combination of command line options:

dnf --disableexcludes=all --disableplugin="*" install bash

2.10.2 Modular Filtering

Please see the modularity documentation for details on how Modular Filtering works.

With modularity, only RPM packages from active module streams are included in the available package set. RPM packages from inactive module streams, as well as non-modular packages with the same name or provides as a package from an active module stream, are filtered out. Modular filtering is not applied to packages added from the command line, installed packages, or packages from repositories with module_hotfixes=true in their .repo file.

Disabling of modular filtering is not recommended, because it could cause the system to get into a broken state. To disable modular filtering for a particular repository, specify module_hotfixes=true in the .repo file or use --setopt=<repo_id>.module_hotfixes=true.

To discover the module which contains an excluded package use dnf module provides.
2.11 Metadata Synchronization

Correct operation of DNF depends on having access to up-to-date data from all enabled repositories but contacting remote mirrors on every operation considerably slows it down and costs bandwidth for both the client and the repository provider. The `metadata_expire` (see `dnf.conf(5)`) repository configuration option is used by DNF to determine whether a particular local copy of repository data is due to be re-synced. It is crucial that the repository providers set the option well, namely to a value where it is guaranteed that if particular metadata was available in time \( T \) on the server, then all packages it references will still be available for download from the server in time \( T + \text{metadata_expire} \).

To further reduce the bandwidth load, some of the commands where having up-to-date metadata is not critical (e.g. the `list` command) do not look at whether a repository is expired and whenever any version of it is locally available to the user's account, it will be used. For non-root use, see also the `--cacheonly` switch. Note that in all situations the user can force synchronization of all enabled repositories with the `--refresh` switch.

2.12 Configuration Files Replacement Policy

The updated packages could replace the old modified configuration files with the new ones or keep the older files. Neither of the files are actually replaced. To the conflicting ones RPM gives additional suffix to the origin name. Which file should maintain the true name after transaction is not controlled by package manager but is specified by each package itself, following packaging guideline.

2.13 Files

**Cache Files** /var/cache/dnf

**Main Configuration** /etc/dnf/dnf.conf

**Repository** /etc/yum.repos.d/

2.14 See Also

- ‘DNF’_ project homepage (https://github.com/rpm-software-management/dnf/)
- ‘YUM’_ project homepage (http://yum.baseurl.org/)
3.1 Description

‘DNF’ by default uses the global configuration file at `/etc/dnf/dnf.conf` and all *.repo files found under `/etc/yum.repos.d`. The latter is typically used for repository configuration and takes precedence over global configuration.

The configuration file has INI format consisting of section declaration and `name=value` options below each on separate line. There are two types of sections in the configuration files: main and repository. Main section defines all global configuration options and should be only one.

The repository sections define the configuration for each (remote or local) repository. The section name of the repository in brackets serve as repo ID reference and should be unique across configuration files. The allowed characters of repo ID string are lower and upper case alphabetic letters, digits, - , and . The minimal repository configuration file should aside from repo ID consists of `baseurl`, `metalink` or `mirrorlist` option definition.

3.2 Distribution-Specific Configuration

Configuration options, namely `best` and `skip_if_unavailable`, can be set in the DNF configuration file by your distribution to override the DNF defaults.

3.3 [main] Options

`allow_vendor_change boolean`

If disabled dnf will stick to vendor when upgrading or downgrading rpms. Default is `True`

**Warning:** This option is currently not supported for `downgrade` and `distro-sync` commands
arch string

The architecture used for installing packages. By default this is auto-detected. Often used together with ignore-arch option.

assumeno boolean

If enabled dnf will assume No where it would normally prompt for confirmation from user input. Default is False.

assumeyes boolean

If enabled dnf will assume Yes where it would normally prompt for confirmation from user input (see also defaultyes). Default is False.

autocheck_running_kernel boolean

Automatic check whether there is installed newer kernel module with security update than currently running kernel. Default is True.

basearch string

The base architecture used for installing packages. By default this is auto-detected.

best boolean

True instructs the solver to either use a package with the highest available version or fail. On False, do not fail if the latest version cannot be installed and go with the lower version. The default is False. Note this option in particular can be set in your configuration file by your distribution. Also note that the use of the highest available version is only guaranteed for the packages directly requested and not for their dependencies.

cachedir string

Path to a directory used by various DNF subsystems for storing cache data. Has a reasonable root-writable default depending on the distribution. DNF needs to be able to create files and directories at this location.

cacheonly boolean

If set to True DNF will run entirely from system cache, will not update the cache and will use it even in case it is expired. Default is False.

check_config_file_age boolean

Specifies whether dnf should automatically expire metadata of repos, which are older than their corresponding configuration file (usually the dnf.conf file and the foo.repo file). Default is True (perform the check). Expire of metadata is also affected by metadata age. See also metadata_expire.

clean_requirements_on_remove boolean

Remove dependencies that are no longer used during dnf remove. A package only qualifies for removal via clean_requirements_on_remove if it was installed through DNF but not on explicit user request, i.e. it was pulled in as a dependency. The default is True. (installonlypkgs are never automatically removed.)

config_file_path string

Path to the default main configuration file. Default is /etc/dnf/dnf.conf.

debuglevel integer

Debug messages output level, in the range 0 to 10. The higher the number the more debug output is put to stdout. Default is 2.

debug_solver boolean

Controls whether the libinstall debug files should be created when solving the transaction. The debug files are created in the /debugdata directory. Default is False.
**defaultyes** boolean

If enabled the default answer to user confirmation prompts will be Yes. Not to be confused with **assumeyes** which will not prompt at all. Default is False.

**diskspacecheck** boolean

Controls whether rpm should check available disk space during the transaction. Default is True.

**errorlevel** integer

Error messages output level, in the range 0 to 10. The higher the number the more error output is put to stderr. Default is 3. This is deprecated in DNF and overwritten by --verbose commandline option.

**exclude_from_weak** list

Prevent installing packages as weak dependencies (recommends or supplements). The packages can be specified by a name or a glob and separated by a comma. Defaults to [].

**exclude_from_weak_autodetect** boolean

If enabled, dnf will autodetect unmet weak dependencies (recommends or supplements) of packages installed on the system. Providers of these weak dependencies will not be installed by dnf as weak dependencies any more (they will still be installed if pulled in as a regular dependency). Defaults to true.

**exit_on_lock** boolean

Should the dnf client exit immediately when something else has the lock. Default is False.

**gpgkey_dns_verification** boolean

Should the dnf attempt to automatically verify GPG verification keys using the DNS system. This option requires the unbound python module (python3-unbound) to be installed on the client system. This system has two main features. The first one is to check if any of the already installed keys have been revoked. Automatic removal of the key is not yet available, so it is up to the user, to remove revoked keys from the system. The second feature is automatic verification of new keys when a repository is added to the system. In interactive mode, the result is written to the output as a suggestion to the user. In non-interactive mode (i.e. when -y is used), this system will automatically accept keys that are available in the DNS and are correctly signed using DNSSEC. It will also accept keys that do not exist in the DNS system and their NON-existence is cryptographically proven using DNSSEC. This is mainly to preserve backward compatibility. Default is False.

**group_package_types** list

List of the following: optional, default, mandatory. Tells dnf which type of packages in groups will be installed when 'groupinstall' is called. Default is: default, mandatory.

**ignorearch** boolean

If set to True, RPM will allow attempts to install packages incompatible with the CPU’s architecture. Defaults to False. Often used together with arch option.

**installonlypkgs** list

List of provide names of packages that should only ever be installed, never upgraded. Kernels in particular fall into this category. These packages are never removed by dnf autoremove even if they were installed as dependencies (see clean_requirements_on_remove for auto removal details). This option append the list values to the default installonlypkgs list used by DNF. The number of kept package versions is regulated by installonly_limit.

**installonly_limit** integer

Number of installonly packages allowed to be installed concurrently. Defaults to 3. The minimal number of installonly packages is 2. Value 0 means unlimited number of installonly packages. Value 1 is explicitly not allowed since it complicates kernel upgrades due to protection of the running kernel from removal.
installroot string
The root of the filesystem for all packaging operations. It requires an absolute path. See also \texttt{--installroot commandline option}.

install_weak_deps boolean
When this option is set to True and a new package is about to be installed, all packages linked by weak dependency relation (Recommends or Supplements flags) with this package will be pulled into the transaction. Default is True.

keepcache boolean
Keeps downloaded packages in the cache when set to True. Even if it is set to False and packages have not been installed they will still persist until next successful transaction. The default is False.

logdir string
Directory where the log files will be stored. Default is /var/log.

logfilelevel integer
Log file messages output level, in the range 0 to 10. The higher the number the more debug output is put to logs. Default is 9.

This option controls dnf.log, dnf.librepo.log and hawkey.log. Although dnf.librepo.log and hawkey.log are affected only by setting the logfilelevel to 10.

log_compress boolean
When set to True, log files are compressed when they are rotated. Default is False.

log_rotate integer
Log files are rotated \texttt{log_rotate} times before being removed. If \texttt{log_rotate} is 0, the rotation is not performed. Default is 4.

log_size storage size
Log files are rotated when they grow bigger than \texttt{log_size} bytes. If \texttt{log_size} is 0, the rotation is not performed. The default is 1 MB. Valid units are ‘k’, ‘M’, ‘G’.

The size applies for individual log files, not the sum of all log files. See also \texttt{log_rotate}.

metadata_timer_sync time in seconds
The minimal period between two consecutive makecache timer runs. The command will stop immediately if it’s less than this time period since its last run. Does not affect simple makecache run. Use 0 to completely disable automatic metadata synchronizing. The default corresponds to three hours. The value is rounded to the next commenced hour.

module_obsoletes boolean
This option controls whether dnf should apply modular obsoletes when possible.

module_platform_id string
Set this to \$name:\$stream to override PLATFORM_ID detected from /etc/os-release. It is necessary to perform a system upgrade and switch to a new platform.

module_stream_switch boolean
This option controls whether it’s possible to switch enabled streams of a module.

multilib_policy string
Controls how multilib packages are treated during install operations. Can either be "best" (the default) for the depresolver to prefer packages which best match the system’s architecture, or "all" to install all available packages with compatible architectures.

**obsoletes boolean**

This option only has affect during an install/update. It enables dnf’s obsoletes processing logic, which means it makes dnf check whether any dependencies of given package are no longer required and removes them. Useful when doing distribution level upgrades. Default is ‘true’.

Command-line option: `--obsoletes`

**persistdir string**

Directory where DNF stores its persistent data between runs. Default is "'/var/lib/dnf'".

**pluginconfpath list**

List of directories that are searched for plugin configurations to load. All configuration files found in these directories, that are named same as a plugin, are parsed. The default path is '/etc/dnf/plugins'.

**pluginpath list**

List of directories that are searched for plugins to load. Plugins found in *any of the directories* in this configuration option are used. The default contains a Python version-specific path.

**plugins boolean**

Controls whether the plugins are enabled. Default is True.

**protected_packages list**

List of packages that DNF should never completely remove. They are protected via Obsoletes as well as user/plugin removals.

The default is: `dnf, glob:/etc/yum/protected.d/*.conf` and `glob:/etc/dnf/protected.d/*.conf`. So any packages which should be protected can do so by including a file in `/etc/dnf/protected.d` with their package name in it.

DNF will protect also the package corresponding to the running version of the kernel. See also `protect_running_kernel` option.

**protect_running_kernel boolean**

Controls whether the package corresponding to the running version of kernel is protected from removal. Default is True.

**releasever string**

Used for substitution of `releasever` in the repository configuration. See also repo variables.

**reposdir list**

DNF searches for repository configuration files in the paths specified by reposdir. The behavior of reposdir could differ when it is used along with `--installroot` option.

**rpmverbosity string**

RPM debug scriptlet output level. One of: critical, emergency, error, warn, info or debug. Default is info.

**strict boolean**

If disabled, all unavailable packages or packages with broken dependencies given to DNF command will be skipped without raising the error causing the whole operation to fail. Currently works for install command only. The default is True.
tsflags list

List of strings adding extra flags for the RPM transaction.

<table>
<thead>
<tr>
<th>tsflag value</th>
<th>RPM Transaction Flag</th>
</tr>
</thead>
<tbody>
<tr>
<td>noscripts</td>
<td>RPMTRANS_FLAG_NOSCRIPTS</td>
</tr>
<tr>
<td>test</td>
<td>RPMTRANS_FLAG_TEST</td>
</tr>
<tr>
<td>notriggers</td>
<td>RPMTRANS_FLAG_NOTRIGGERS</td>
</tr>
<tr>
<td>nodocs</td>
<td>RPMTRANS_FLAG_NODOCS</td>
</tr>
<tr>
<td>justdb</td>
<td>RPMTRANS_FLAG_JUSTDB</td>
</tr>
<tr>
<td>nocontexts</td>
<td>RPMTRANS_FLAG_NOCONTEXTS</td>
</tr>
<tr>
<td>nocaps</td>
<td>RPMTRANS_FLAG_NOCAPS</td>
</tr>
<tr>
<td>nocrypto</td>
<td>RPMTRANS_FLAG_NOFILEDIGEST</td>
</tr>
</tbody>
</table>

The nocrypto option will also set the _RPMVSF_NOSIGNATURES and _RPMVSF_NODIGESTS VS flags. The test option provides a transaction check without performing the transaction. It includes downloading of packages, gpg keys check (including permanent import of additional keys if necessary), and rpm check to prevent file conflicts. The nocaps is supported with rpm-4.14 or later. When nocaps is used but rpm doesn’t support it, DNF only reports it as an invalid tsflag.

upgrade_group_objects_upgrade boolean

Set this to False to disable the automatic running of group upgrade when running the upgrade command. Default is True (perform the operation).

varsdir list

List of directories where variables definition files are looked for. Defaults to "/etc/dnf/vars", "/etc/yum/vars". See variable files in Configuration reference.

zchunk boolean

Enables or disables the use of repository metadata compressed using the zchunk format (if available). Default is True.

3.4 [main] Options - Colors

color string

Controls if DNF uses colored output on the command line. Possible values: “auto”, “never”, “always”. Default is “auto”.

color_list_available_downgrade color

Color of available packages that are older than installed packages. The option is used during list operations. Default is magenta.

color_list_available_install color

Color of packages that are available for installation and none of their versions in installed. The option is used during list operations. Default is bold,cyan.

color_list_available_reinstall color

Color of available packages that are identical to installed versions and are available for reinstalls. Default is bold,underline,green. The option is used during list operations.
color_list_available_upgrade color

Color of available packages that are newer than installed packages. Default is bold, blue. The option is used during list operations.

color_list_installed_extra color

Color of installed packages that do not have any version among available packages. The option is used during list operations. Default is bold, red.

color_list_installed_newer color

Color of installed packages that are newer than any version among available packages. The option is used during list operations. Default is bold, yellow.

color_list_installed_older color

Color of installed packages that are older than any version among available packages. The option is used during list operations. Default is yellow.

color_list_installed_reinstall color

Color of installed packages that are among available packages and can be reinstalled. The option is used during list operations. Default is cyan.

color_search_match color

Color of patterns matched in search output. Default is bold, magenta.

color_update_installed color

Color of removed packages. Default is red. This option is used during displaying transactions.

color_update_local color

Color of local packages that are installed from the @commandline repository. This option is used during displaying transactions. Default is green.

color_update_remote color

Color of packages that are installed/upgraded/downgraded from remote repositories. This option is used during displaying transactions. Default is bold, green.

3.5 Repo Options

baseurl list

List of URLs for the repository. Defaults to [].

URLs are tried in the listed order (equivalent to yum's “failovermethod=priority” behaviour).

cost integer

The relative cost of accessing this repository, defaulting to 1000. This value is compared when the priorities of two repositories are the same. The repository with the lowest cost is picked. It is useful to make the library prefer on-disk repositories to remote ones.

enabled boolean

Include this repository as a package source. The default is True.
**gpgkey** list of strings  
URLs of a GPG key files that can be used for signing metadata and packages of this repository, empty by default. If a file can not be verified using the already imported keys, import of keys from this option is attempted and the keys are then used for verification.

**metalink** string  
URL of a metalink for the repository. Defaults to None.

**mirrorlist** string  
URL of a mirrorlist for the repository. Defaults to None.

**module_hotfixes** boolean  
Set this to True to disable module RPM filtering and make all RPMs from the repository available. The default is False. This allows user to create a repository with cherry-picked hotfixes that are included in a package set on a modular system.

**name** string  
A human-readable name of the repository. Defaults to the ID of the repository.

**priority** integer  
The priority value of this repository, default is 99. If there is more than one candidate package for a particular operation, the one from a repo with the lowest priority value is picked, possibly despite being less convenient otherwise (e.g. by being a lower version).

**type** string  
Type of repository metadata. Supported values are: rpm-md. Aliases for rpm-md: rpm, repomd, rpmmd, yum, YUM.

### 3.6 Repo Variables

Right side of every repo option can be enriched by the following variables:

$arch  
Refers to the system’s CPU architecture e.g. aarch64, i586, i686 and x86_64.

$basearch  
Refers to the base architecture of the system. For example, i686 and i586 machines both have a base architecture of i386, and AMD64 and Intel64 machines have a base architecture of x86_64.

$releasever  
Refers to the release version of operating system which DNF derives from information available in RP-MDB.

In addition to these hard coded variables, user-defined ones can also be used. They can be defined either via variable files, or by using special environmental variables. The names of these variables must be prefixed with DNF_VAR_ and they can only consist of alphanumeric characters and underscores:

```
$ DNF_VAR_MY_VARIABLE=value
```

To use such variable in your repository configuration remove the prefix. E.g.:
Note that it is not possible to override the `arch` and `basearch` variables using either variable files or environmental variables.

Although users are encouraged to use named variables, the numbered environmental variables `DNF0` - `DNF9` are still supported:

```
$ DNF1=value
```

### 3.7 Options for both [main] and Repo

Some options can be applied in either the main section, per repository, or in a combination. The value provided in the main section is used for all repositories as the default value, which repositories can then override in their configuration.

**bandwidth** storage size

Total bandwidth available for downloading. Meaningful when used with the `throttle` option. Storage size is in bytes by default but can be specified with a unit of storage. Valid units are ‘k’, ‘M’, ‘G’.

**countme** boolean

Determines whether a special flag should be added to a single, randomly chosen metalink/mirrorlist query each week. This allows the repository owner to estimate the number of systems consuming it, by counting such queries over a week’s time, which is much more accurate than just counting unique IP addresses (which is subject to both overcounting and undercounting due to short DHCP leases and NAT, respectively).

The flag is a simple “countme=N” parameter appended to the metalink and mirrorlist URL, where N is an integer representing the “longevity” bucket this system belongs to. The following 4 buckets are defined, based on how many full weeks have passed since the beginning of the week when this system was installed: 1 = first week, 2 = first month (2-4 weeks), 3 = six months (5-24 weeks) and 4 = more than six months (> 24 weeks). This information is meant to help distinguish short-lived installs from long-term ones, and to gather other statistics about system lifecycle.

Default is False.

**deltarpm** boolean

When enabled, DNF will save bandwidth by downloading much smaller delta RPM files, rebuilding them to RPM locally. However, this is quite CPU and I/O intensive. Default is True.

**deltarpm_percentage** integer

When the relative size of delta vs pkg is larger than this, delta is not used. Default value is 75 (Deltas must be at least 25% smaller than the pkg). Use `0` to turn off delta rpm processing. Local repositories (with `file://` baseurl) have delta rpms turned off by default.

**enablegroups** boolean

Determines whether DNF will allow the use of package groups for this repository. Default is True (package groups are allowed).

**excludepkgs** list
Exclude packages of this repository, specified by a name or a glob and separated by a comma, from all operations. Can be disabled using --disableexcludes command line switch. Defaults to [].

fastestmirror boolean

If enabled a metric is used to find the fastest available mirror. This overrides the order provided by the mirrorlist/metalink file itself. This file is often dynamically generated by the server to provide the best download speeds and enabling fastestmirror overrides this. The default is False.

gpgcheck boolean

Whether to perform GPG signature check on packages found in this repository. The default is False.

This option can only be used to strengthen the active RPM security policy set with the %_pkgverifylevel macro (see the /usr/lib/rpm/macros file for details). That means, if the macro is set to 'signature' or 'all' and this option is False, it will be overridden to True during DNF runtime, and a warning will be printed. To squelch the warning, make sure this option is True for every enabled repository, and also enable localpkg_gpgcheck.

includepkgs list

Include packages of this repository, specified by a name or a glob and separated by a comma, in all operations. Inverse of excludepkgs, DNF will exclude any package in the repository that doesn’t match this list. This works in conjunction with excludepkgs and doesn’t override it, so if you ‘excludepkgs=*.*386’ and ‘includepkgs=python*’ then only packages starting with python that do not have an i386 arch will be seen by DNF in this repo. Can be disabled using --disableexcludes command line switch. Defaults to [].

ip_resolve IP address type

Determines how DNF resolves host names. Set this to ‘4’/IPv4’ or ‘6’/IPv6’ to resolve to IPv4 or IPv6 addresses only. By default, DNF resolves to either addresses.

localpkg_gpgcheck boolean

Whether to perform a GPG signature check on local packages (packages in a file, not in a repository). The default is False. This option is subject to the active RPM security policy (see gpgcheck for more details).

max_parallel_downloads integer

metadata_expire time in seconds

The period after which the remote repository is checked for metadata update and in the positive case the local metadata cache is updated. The default corresponds to 48 hours. Set this to -1 or never to make the repo never considered expired. Expire of metadata can be also triggered by change of timestamp of configuration files (dnf.conf, <repo>.repo). See also check_config_file_age.

minrate storage size

This sets the low speed threshold in bytes per second. If the server is sending data at the same or slower speed than this value for at least timeout option seconds, DNF aborts the connection. The default is 1000. Valid units are ‘k’, ‘M’, ‘G’.

password string

The password to use for connecting to a repository with basic HTTP authentication. Empty by default.

proxy string

URL of a proxy server to connect through. Set to an empty string to disable the proxy setting inherited from the main section and use direct connection instead. The expected format of this option is <scheme>://<ip-or-hostname>[:<port>]. (For backward compatibility, ‘_none_’ can be used instead of the empty string.)
Note: The curl environment variables (such as `http_proxy`) are effective if this option is unset. See the `curl` man page for details.

**proxy_username** *string*

The username to use for connecting to the proxy server. Empty by default.

**proxy_password** *string*

The password to use for connecting to the proxy server. Empty by default.

**proxy_auth_method** *string*

The authentication method used by the proxy server. Valid values are

<table>
<thead>
<tr>
<th>method</th>
<th>meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>basic</td>
<td>HTTP Basic authentication</td>
</tr>
<tr>
<td>digest</td>
<td>HTTP Digest authentication</td>
</tr>
<tr>
<td>negotiate</td>
<td>HTTP Negotiate (SPNEGO) authentication</td>
</tr>
<tr>
<td>ntlm</td>
<td>HTTP NTLM authentication</td>
</tr>
<tr>
<td>digest_ie</td>
<td>HTTP Digest authentication with an IE flavor</td>
</tr>
<tr>
<td>ntlm_wb</td>
<td>NTLM delegating to winbind helper</td>
</tr>
<tr>
<td>none</td>
<td>None auth method</td>
</tr>
<tr>
<td>any</td>
<td>All suitable methods</td>
</tr>
</tbody>
</table>

Defaults to `any`

**proxy_sslcacert** *string*

Path to the file containing the certificate authorities to verify proxy SSL certificates. Empty by default - uses system default.

**proxy_sslverify** *boolean*

When enabled, proxy SSL certificates are verified. If the client cannot be authenticated, connecting fails and the repository is not used any further. If `False`, SSL connections can be used, but certificates are not verified. Default is `True`.

**proxy_sslclientcert** *string*

Path to the SSL client certificate used to connect to proxy server. Empty by default.

**proxy_sslclientkey** *string*

Path to the SSL client key used to connect to proxy server. Empty by default.

**repo_gpgcheck** *boolean*

Whether to perform GPG signature check on this repository’s metadata. The default is `False`.

**retries** *integer*

Set the number of total retries for downloading packages. The number is accumulative, so e.g. for `retries=10`, `dnf` will fail after any package download fails for eleventh time. Setting this to `0` makes `dnf` try forever. Default is `10`.

**skip_if_unavailable** *boolean*

If enabled, DNF will continue running and disable the repository that couldn’t be synchronized for any reason. This option doesn’t affect skipping of unavailable packages after dependency resolution. To check inaccessibility of repository use it in combination with `refresh command line option`. The default is `False`. Note this option in particular can be set in your configuration file by your distribution.
sslca.cert string
Path to the file containing the certificate authorities to verify SSL certificates. Empty by default - uses system default.

sslverify boolean
When enabled, remote SSL certificates are verified. If the client can not be authenticated, connecting fails and the repository is not used any further. If False, SSL connections can be used, but certificates are not verified. Default is True.

sslverifystatus boolean
When enabled, revocation status of the server certificate is verified using the “Certificate Status Request” TLS extension (aka. OCSP stapling). Default is False.

sslclientcert string
Path to the SSL client certificate used to connect to remote sites. Empty by default.

sslclientkey string
Path to the SSL client key used to connect to remote sites. Empty by default.

throttle storage size
Limits the downloading speed. It might be an absolute value or a percentage, relative to the value of the bandwidth option option. 0 means no throttling (the default). The absolute value is in bytes by default but can be specified with a unit of storage. Valid units are ‘k’, ‘M’, ‘G’.

timeout time in seconds
Number of seconds to wait for a connection before timing out. Used in combination with minrate option option. Defaults to 30 seconds.

username string
The username to use for connecting to repo with basic HTTP authentication. Empty by default.

user_agent string
The User-Agent string to include in HTTP requests sent by DNF. Defaults to

```
libdnf (NAME VERSION_ID; VARIANT_ID; OS.BASEARCH)
```

where NAME, VERSION_ID and VARIANT_ID are OS identifiers read from the os-release(5) file, and OS and BASEARCH are the canonical OS name and base architecture, respectively. Example:

```
libdnf (Fedora 31; server; Linux.x86_64)
```

## 3.8 Types of Options

boolean This is a data type with only two possible values.

One of following options can be used: 1, 0, True, False, yes, no

integer It is a whole number that can be written without a fractional component.

list It is an option that could represent one or more strings separated by space or comma characters.

string It is a sequence of symbols or digits without any whitespace character.

color A string describing color and modifiers separated with a comma, for example “red,bold”.
• Colors: black, blue, cyan, green, magenta, red, white, yellow
• Modifiers: bold, blink, dim, normal, reverse, underline

3.9 Files

Cache Files /var/cache/dnf
Main Configuration File /etc/dnf/dnf.conf
Repository /etc/yum.repos.d/
Variables Any properly named file in /etc/dnf/vars is turned into a variable named after the filename (or overrides any of the above variables but those set from commandline). Filenames may contain only alphanumeric characters and underscores and be in lowercase. Variables are also read from /etc/yum/vars for YUM compatibility reasons.

4.1 Synopsis

dnf-automatic [<config file>]

4.2 Description

Alternative CLI to dnf upgrade with specific facilities to make it suitable to be executed automatically and regularly from systemd timers, cron jobs and similar.

The operation of the tool is usually controlled by the configuration file or the function-specific timer units (see below). The command only accepts a single optional argument pointing to the config file, and some control arguments intended for use by the services that back the timer units. If no configuration file is passed from the command line, /etc/dnf/automatic.conf is used.

The tool synchronizes package metadata as needed and then checks for updates available for the given system and then either exits, downloads the packages or downloads and applies the packages. The outcome of the operation is then reported by a selected mechanism, for instance via the standard output, email or MOTD messages.

The systemd timer unit dnf-automatic.timer will behave as the configuration file specifies (see below) with regard to whether to download and apply updates. Some other timer units are provided which override the configuration file with some standard behaviours:

- dnf-automatic-notifyonly
- dnf-automatic-download
- dnf-automatic-install

Regardless of the configuration file settings, the first will only notify of available updates. The second will download, but not install them. The third will download and install them.
4.3 Run dnf-automatic

You can select one that most closely fits your needs, customize /etc/dnf/automatic.conf for any specific behaviors, and enable the timer unit.

For example: systemctl enable --now dnf-automatic-notifyonly.timer

4.4 Configuration File Format

The configuration file is separated into topical sections.

4.4.1 [commands] section

Setting the mode of operation of the program.

apply_updates boolean, default: False

Whether packages comprising the available updates should be applied by dnf-automatic.timer, i.e. installed via RPM. Implies download_updates. Note that if this is set to False, downloaded packages will be left in the cache till the next successful DNF transaction. Note that the other timer units override this setting.

download_updates boolean, default: False

Whether packages comprising the available updates should be downloaded by dnf-automatic.timer. Note that the other timer units override this setting.

network_online_timeout time in seconds, default: 60

Maximal time dnf-automatic will wait until the system is online. 0 means that network availability detection will be skipped.

random_sleep time in seconds, default: 0

Maximal random delay before downloading. Note that, by default, the systemd timers also apply a random delay of up to 1 hour.

upgrade_type either one of default, security, default: default

What kind of upgrades to look at. default signals looking for all available updates, security only those with an issued security advisory.

4.4.2 [emitters] section

Choosing how the results should be reported.

emit_via list, default: email, stdio, motd

List of emitters to report the results through. Available emitters are stdio to print the result to standard output, command to send the result to a custom command, command_email to send an email using a command, and email to send the report via email and motd sends the result to /etc/motd file.

system_name string, default: hostname of the given system

How the system is called in the reports.
4.4.3 [command] section

The command emitter configuration. Variables usable in format string arguments are body with the message body.

command_format  format string, default: cat

The shell command to execute.

stdin_format  format string, default: {body}

The data to pass to the command on stdin.

4.4.4 [command_email] section

The command email emitter configuration. Variables usable in format string arguments are body with message body, subject with email subject, email_from with the “From:” address and email_to with a space-separated list of recipients.

command_format  format string, default: mail -Ssendwait -s {subject} -r {email_from} {email_to}

The shell command to execute.

email_from  string, default: root

Message’s “From:” address.

eemail_to  list, default: root

List of recipients of the message.

stdin_format  format string, default: {body}

The data to pass to the command on stdin.

4.4.5 [email] section

The email emitter configuration.

email_from  string, default: root

Message’s “From:” address.

email_host  string, default: localhost

Hostname of the SMTP server used to send the message.

email_to  list, default: root

List of recipients of the message.

4.4.6 [base] section

Can be used to override settings from DNF’s main configuration file. See DNF Configuration Reference.
5.1 Introduction

The provided Python API to DNF is supposed to mainly allow writing the following two categories of programs:

1. plugins to DNF which extend functionality of the system’s DNF installation.
2. extension applications that embed DNF (by importing its Python modules) to perform specific package management tasks.

Please refer to the DNF Use Cases where you can find examples of API usage.

Note: The API consists of exactly those elements described in this document, items not documented here can change release to release. Opening a ‘bugzilla’ if certain needed functionality is not exposed is the right thing to do.

5.2 Versioning

DNF follows the Semantic Versioning as defined at http://semver.org/.
This basically means that if your piece of software depends on e.g. DNF 1.1, the requirement can be specified as 1.1 <= dnf < 2. In other words, you can be sure that your software will be API-compatible with any later release of DNF until the next major version is issued. The same applies for the CLI compatibility.

Incompatible API changes are subject to our deprecation policy. Deprecated API items (classes, methods, etc.) are designated as such in the DNF Release Notes. The first release where support for such items can be dropped entirely must have, relative to the deprecating release, a higher major version number. DNF will log a warning when a deprecated item is used.

5.3 Contents

API Documentation Contents

5.3.1 Common Provisions of the DNF API

Logging

DNF uses the standard Python logging module to do its logging. Three standard loggers are provided:

- **dnf**, used by the core and CLI components of DNF. Messages logged via this logger can end up written to the stdout (console) the DNF process is attached too. For this reason messages logged on the INFO level or above should be marked for localization (if the extension uses it).

- **dnf.plugin** should be used by plugins for debugging and similar messages that are generally not written to the standard output streams but logged into the DNF logfile.

- **dnf.rpm** is a logger used by RPM transaction callbacks. Plugins and extensions should not manipulate this logger.

Extensions and plugins can add or remove logging handlers of these loggers at their own discretion.

5.3.2 Base—The centerpiece of DNF

```python
class dnf.Base

Instances of dnf.Base are the central point of functionality supplied by DNF. An application will typically create a single instance of this class which it will keep for the runtime needed to accomplish its packaging tasks. Plugins are managed by DNF and get a reference to dnf.Base object when they run.

Base instances are stateful objects holding references to various data sources and data sinks. To properly finalize and close off any handles the object may hold, client code should either call Base.close() when it has finished operations with the instance, or use the instance as a context manager. After the object has left the context, or its Base.close() has been called explicitly, it must not be used. Base.close() will delete all downloaded packages upon successful transaction.

comps
    Is None by default. Explicit load via read_comps() initializes this attribute to a dnf.comps.Comps instance.

conf
    An instance of dnf.conf.Conf, concentrates all the different configuration options. __init__() initializes this to usable defaults.

goal
    An instance of dnf.goal.Goal that this Base object is using.
```
repos
A `dnf.repodict.RepoDict` instance, this member object contains all the repositories available.

sack
The `Sack` that this `Base` object is using. It needs to be explicitly initialized by `fill_sack()`.

transaction
A resolved transaction object, a `dnf.transaction.Transaction` instance, or `None` if no transaction has been prepared yet.

__init__() : 
Init an instance with a reasonable default configuration. The constructor takes no arguments.

add_remote_rpms (path_list, strict=True, progress=None)
This function must be called before anything is added to the `goal`. Adds RPM files in path_list to the sack and return the list of respective `dnf.package.Package` instances. Downloads the RPMs to a temporary file for each path if it is a remote URL. Raises IOError if there are IO problems with files and `strict=True`. Raises `dnf.exceptions.Error` if the `goal` is not empty. `progress`, if given, should be a `DownloadProgress` instance which can be used to monitor the progress of the download.

add_security_filters (cmp_type, types=(), advisory=(), bugzilla=(), cves=(), severity=())
It modifies results of install, upgrade, and distrosync methods according to provided filters. `cmp_type` - only 'eq' or 'gte' allowed types - List or tuple with strings. Eg. bugfix, enhancement, newpackage, security advisory - List or tuple with strings. Eg. FEDORA-2201-123 bugzilla - List or tuple with strings. Include packages that fix a Bugzilla ID, Eg. 123/123. cves - List or tuple with strings. Include packages that fix a CVE (Common Vulnerabilities and Exposures) ID. Eg. CVE-2201-0123 severity - List or tuple with strings. Includes packages that provide a fix for an issue of the specified severity.

reset_security_filters ()
Reset all security filters

close ()
Close all external handles the object holds. This is called automatically via context manager mechanism if the instance is handled using the `with` statement.

init_plugins ([disabled_glob=None, cli=None])
Initialize plugins. If you want to disable some plugins pass the list of their name patterns to `disabled_glob`. When run from interactive script then also pass your `dnf.cli.Cli` instance.

pre_configure_plugins ()
Configure plugins by running their pre_configure() method. It makes possible to change variables before repo files and rpmDB are loaded. It also makes possible to create internal repositories that will be affected by --disablerepo and --enablerepo.

configure_plugins ()
Configure plugins by running their configure() method.

fill_sack ([load_system_repo=True, load_available_repos=True])
Setup the package sack. If `load_system_repo` is True, load information about packages in the local RPMDB into the sack. Else no package is considered installed during dependency solving. If `load_available_repos` is True, load information about packages from the available repositories into the sack.

This operation will call `load()` for repos as necessary and can take a long time. Adding repositories or changing repositories’ configuration does not affect the information within the sack until `fill_sack()` has been called.

Before this method is invoked, the client application should setup any explicit configuration relevant to the operation. This will often be at least `conf.cachedir` and the substitutions used in repository URLs. See `Conf.substitutions`.

5.3. Contents 59
Throws *IOException* exception in case cached metadata could not be opened.

Example:

```python
#!/usr/bin/python3
import dnf

base = dnf.Base()
conf = base.conf
conf.cachedir = '/tmp/my_cache_dir'
conf.substitutions['releasever'] = '30'
conf.substitutions['basearch'] = 'x86_64'

base.repos.add_new_repo('my-repo', conf,
    baseurl=['http://download.fedoraproject.org/pub/fedora/linux/releases/
        →$releasever/Everything/$basearch/os/'])
base.fill_sack()

print("Enabled repositories:")
for repo in base.repos.iter_enabled():
    print("id: {}", format(repo.id))
    print("baseurl: {}", format(repo.baseurl))
```

**fill_sack_from_repos_in_cache** (*load_system_repo=True*)

Prepare Sack and Goal objects and load all enabled repositories from cache only, it doesn’t download anything and it doesn’t check if metadata are expired. To successfully load a repository cache it requires repomd.xml plus metadata (xml, yaml) or repomd.xml plus generated cache files (solv, solvx). If there is not enough metadata given repo is either skipped or it throws a *dnf.exceptions.RepoError* exception depending on *dnf.conf.Conf.skip_if_unavailable* configuration.

All additional metadata are loaded if present but are not generally required. Note that some metadata like updateinfo.xml get processed into a solvx cache file and its sufficient to have either xml or solvx. Module metadata represented by modules.yaml are not processed therefore they are needed when they are defined in repomd.xml.

Example of loading all configured repositories from cache and printing available packages’ names:

```python
#!/usr/bin/python3
import dnf

with dnf.Base() as base:
    base.read_all_repos()
    base.fill_sack_from_repos_in_cache(*load_system_repo=False*)

    query = base.sack.query().available()
    for pkg in query.run():
        print(pkg.name)
```

Example of loading a single repository and printing available packages’ names without reading repository configuration:

```python
#!/usr/bin/python3
import dnf

with dnf.Base() as base:
    repo = dnf.repo.Repo("rawhide", base.conf)
```

(continues on next page)
Repository cache is also identified by its source therefore to find it, you need to set metalink, mirrorlist or baseurl to the same value from which it was created.

```python
repo.metalink = "https://mirrors.fedoraproject.org/metalink?repo=rawhide&arch=x86_64"

base.repos.add(repo)

base.fill_sack_from_repos_in_cache(load_system_repo=False)

query = base.sack.query().available()
for pkg in query.run():
    print(pkg.name)
```

do_transaction([display])

Perform the resolved transaction. Use the optional `display` object(s) to report the progress. `display` can be either an instance of a subclass of dnf.callback.TransactionProgress or a sequence of such instances. Raise dnf.exceptions.Error or dnf.exceptions.TransactionCheckError.

download_packages(pkglist, progress=None, callback_total=None)

Download packages in `pkglist` from remote repositories. Packages from local repositories or from the command line are not downloaded. `progress`, if given, should be a DownloadProgress and can be used by the caller to monitor the progress of the download. `callback_total` is a function accepting two parameters: total size of the downloaded content in bytes and time when the download process started, in seconds since the epoch. Raises DownloadError if some packages failed to download.

group_install(group_id, pkg_types, exclude=None, strict=True)

Mark group with corresponding `group_id` installed and mark the packages in the group for installation. Return the number of packages that the operation has marked for installation. `pkg_types` is a sequence of strings determining the kinds of packages to be installed, where the respective groups can be selected by including "mandatory", "default" or "optional" in it. If `exclude` is given, it has to be an iterable of package name glob patterns: group.install() will then not mark the respective packages for installation whenever possible. Parameter `strict` is a boolean indicating whether group packages that exist but are non-installable due to e.g. dependency issues should be skipped (False) or cause transaction to fail to resolve (True). Raises dnf.exceptions.CompsError in case the group doesn’t exist.

group_remove(group_id)

Mark group with corresponding `group_id` not installed. All the packages marked as belonging to this group will be marked for removal. Return the number of packages marked for removal in this call.

group_upgrade(group_id)

Upgrade group with corresponding `group_id`. If there has been packages added to the group’s comps information since installing on the system, they will be marked for installation. Similarly, removed packages get marked for removal. The remaining packages in the group are marked for an upgrade. The operation respects the package types from the original installation of the group.

environment_install(env_id, types, exclude=None, strict=True, exclude_groups=None)

Similar to `group_install()` but operates on environmental groups. `exclude_groups` is an iterable of group IDs that will not be marked as installed. Raises dnf.exceptions.CompsError in case the group doesn’t exist.

environment_remove(env_id)

Similar to `group_remove()` but operates on environmental groups.

environment_upgrade(env_id)

Similar to `group_upgrade()` but operates on environmental groups.
read_all_repos()

Read repository configuration from the main configuration file specified by dnf.conf.Conf.config_file_path and any .repo files under dnf.conf.Conf.reposdir. All the repositories found this way are added to repos.

read_comps (arch_filter=False)

Read comps data from all the enabled repositories and initialize the comps object. If arch_filter is set to True, the result is limited to system basearch.

reset (**kwargs)

Reset the state of different Base attributes. Selecting attributes to reset is controlled by passing the method keyword arguments set to True. When called with no arguments the method has no effect.

<table>
<thead>
<tr>
<th>argument passed</th>
<th>effect</th>
</tr>
</thead>
<tbody>
<tr>
<td>goal=True</td>
<td>drop all the current packaging requests</td>
</tr>
<tr>
<td>repos=True</td>
<td>drop the current repositories (see repos). This won’t affect the package data already loaded into the sack.</td>
</tr>
<tr>
<td>sack=True</td>
<td>drop the current sack (see sack)</td>
</tr>
</tbody>
</table>

resolve (allow_erasing=False)

Resolve the marked requirements and store the resulting dnf.transaction.Transaction into transaction. Raise dnf.exceptions.DepsolveError on a depsolving error. Return True if the resolved transaction is non-empty.

Enabling allow_erasing lets the solver remove other packages while looking to fulfill the current packaging requests. For instance, this is used to allow the solver to remove dependants of a package being removed.

The exact operation of the solver further depends on the dnf.conf.Conf.best setting.

update_cache (timer=False)

Downloads and caches in binary format metadata for all known repos. Tries to avoid downloading whenever possible (e.g. when the local metadata hasn’t expired yet or when the metadata timestamp hasn’t changed).

If ‘timer’ equals ‘True’, DNF becomes more resource-aware, meaning DNF will not do anything if running on battery power and will terminate immediately if it’s too soon after the last successful update_cache operation.

When the method is used after fill_sack(), information about packages will not be updated.

package_signature_check (pkg)

Verify the GPG signature of the given package object. Returns tuple (result, error_string) where result is:

<table>
<thead>
<tr>
<th>result</th>
<th>meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>GPG signature verifies ok or verification is not required.</td>
</tr>
<tr>
<td>1</td>
<td>GPG verification failed but installation of the right GPG key might help.</td>
</tr>
<tr>
<td>2</td>
<td>Fatal GPG verification error, give up.</td>
</tr>
</tbody>
</table>

package_import_key (pkg, askcb=None, fullaskcb=None)

Retrieve a key for a package. If needed, use the given callback to prompt whether the key should be imported. Raises dnf.exceptions.Error if there are errors retrieving the keys.

askcb: callback function to use to ask permission to import a key. The arguments askcb should take are the package object, the userid of the key, and the keyid

fullaskcb: callback function to use to ask permission to import a key. This differs from askcb in that it gets passed a dictionary so that we can expand the values passed.
Callback functions return `True` if the key should be imported, `False` otherwise.

The `Base` class provides a number of methods to make packaging requests that can later be resolved and turned into a transaction. The `pkg_spec` argument some of them take must be a package specification recognized by `dnf.subject.Subject`. If these methods fail to find suitable packages for the operation they raise a `MarkingError`. Note that successful completion of these methods does not necessarily imply that the desired transaction can be carried out (e.g. for dependency reasons).

**downgrade** *(pkg_spec)*
Mark packages matching `pkg_spec` for downgrade.

**install** *(pkg_spec, reponame=None, strict=True, forms=None)*
Mark packages matching `pkg_spec` for installation. `reponame` can be a name of a repository or a list of repository names. If given, the selection of available packages is limited to packages from these repositories. If `strict` is set to False, the installation ignores packages with dependency solving problems. Parameter `forms` has the same meaning as in `dnf.subject.Subject.get_best_query()`.

**package_downgrade** *(pkg, strict=False)*
If `pkg` is a `dnf.package.Package` in an available repository, mark the matching installed package for downgrade to `pkg`. If `strict=False` it ignores problems with dep-solving.

**package_install** *(pkg, strict=True)*
Mark `pkg` (a `dnf.package.Package` instance) for installation. Ignores package that is already installed. `strict` has the same meaning as in `install()`.

**package_upgrade** *(pkg)*
If `pkg` is a `dnf.package.Package` in an available repository, mark the matching installed package for upgrade to `pkg`.

**autoremove** *
Removes all ‘leaf’ packages from the system that were originally installed as dependencies of user-installed packages but which are no longer required by any such package.

**remove** *(pkg_spec, reponame=None, forms=None)*
Mark packages matching `pkg_spec` for removal. `reponame` and `forms` have the same meaning as in `install()`.

**upgrade** *(pkg_spec, reponame=None)*
Mark packages matching `pkg_spec` for upgrade. `reponame` has the same meaning as in `install()`.

**upgrade_all** *(reponame=None)*
Mark all installed packages for an upgrade. `reponame` has the same meaning as in `install()`.

**urlopen** *(url, repo=None, mode='w+b', **kwargs):*
Open the specified absolute `url` and return a file object which respects proxy setting even for non-repo downloads

**install_specs** *(install, exclude=None, reponame=None, strict=True, forms=None)*
Provides unified way to mark packages, groups or modules for installation. The `install` and `exclude` arguments have to be iterable containing specifications of packages (e.g. ‘dnf’) or groups/modules (e.g. ‘@core’). Specifications from the `exclude` list will not be marked for installation. The `reponame, strict` and `forms` parameters have the same meaning as in `install()`. In case of errors the method raises `dnf.exceptions.MarkingErrors`.

Example to install two groups and a package:

```
#!/usr/bin/python3
import dnf
import dnf.cli.progress
```

(continues on next page)
base = dnf.Base()
base.read_all_repos()
base.fill_sack()

base.install_specs(['acpi', '@Web Server', '@core'])
print("Resolving transaction...")
base.resolve()
print("Downloading packages...")
progress = dnf.cli.progress.MultiFileProgressMeter()
base.download_packages(base.transaction.install_set, progress)
print("Installing...")
base.do_transaction()

5.3.3 Exceptions

exception dnf.exceptions.Error
Base class for all DNF Errors.

exception dnf.exceptions.CompsError
Used for errors of comps groups like trying to work with group which is not available.

exception dnf.exceptions.DeprecationWarning
Used to emit deprecation warnings using Python's warnings.warning() function.

exception dnf.exceptions.DepsolveError
Error during transaction dependency resolving.

exception dnf.exceptions.DownloadError
Error during downloading packages from the repositories.

exception dnf.exceptions.MarkingError
Error when DNF was unable to find a match for given package / group / module specification.

exception dnf.exceptions.MarkingErrors
Categorized errors during processing of the request. The available error categories are
no_match_pkg_specs for missing packages, error_pkg_specs for broken packages,
no_match_group_specs for missing groups or modules, error_group_specs for broken groups or
modules and module_depsolv_errors for modular dependency problems.

exception dnf.exceptions.RepoError
Error when loading repositories.

5.3.4 Configuration

Configurable settings of the dnf.Base object are stored into a dnf.conf.Conf instance. The various options are
described here.

class dnf.conf.Conf

This object has attributes corresponding to all configuration options from both “[main] Options” and
“Options for both [main] and Repo” sections. For example setting a proxy to access all repositories:

import dnf

base = dnf.Base()
conf = base.conf
get_reposdir
Returns the value of the first valid reposdir or if unavailable the value of created reposdir (string)

substitutions
An instance of dnf.conf.substitutions.Substitutions class. A mapping of substitutions used in repositories' remote URL configuration. The commonly used ones are:

<table>
<thead>
<tr>
<th>key</th>
<th>meaning</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>arch</td>
<td>architecture of the machine</td>
<td>autodetected</td>
</tr>
<tr>
<td>basearch</td>
<td>the architecture family of the current “arch”</td>
<td>autodetected</td>
</tr>
<tr>
<td>releasever</td>
<td>release name of the system distribution</td>
<td>None</td>
</tr>
</tbody>
</table>

dnf.rpm.detect_releasever() can be used to detect the releasever value.

Following example shows recommended method how to override autodetected architectures:

```python
import dnf
import hawkey

arch = hawkey.detect_arch()
base = dnf.Base()
base.conf.substitutions['arch'] = arch
base.conf.substitutions['basearch'] = dnf.rpm.basearch(arch)
base.fill_sack()
...
```

exclude_pkgs(pkgs)
Exclude all packages in the pkgs list from all operations.

prepend_installroot(option)
Prefix config option named option with installroot.

read(filename=None)
Read configuration options from the main section in filename. Option values not present there are left at their current values. If filename is None, config_file_path is used. Conversely, the configuration path used to load the configuration file that was used is stored into config_file_path before the function returns.

dump()
Print configuration values, including inherited values.

set_or_append_opt_value(name, value_string, priority=PRIO_RUNTIME).
For standard options, sets the value of the option if the priority is equal to or higher than the current priority. For “append” options, appends the values parsed from value_string to the current list of values. If the first parsed element of the list of values is empty and the priority is equal to or higher than the current priority, the current list is replaced with the new values. If the priority is higher than the current priority, the current priority is increased to the priority. Raises dnf.exceptions.ConfigError if the option with the given name does not exist or value_string contains an invalid value or not allowed value.

write_raw_configfile(filename, section_id, substitutions, modify)
Update or create config file. Where filename represents name of config file (.conf or .repo); section_id
represents id of modified section (e.g. main, fedora, updates); substitutions represents an instance of base.conf.substitutions; modify represents dict of modified options.

class dnf.conf.substitutions.Substitutions

update_from_etc(installroot, varsdir=('/etc/yum/vars/', '/etc/dnf/vars/'))
Read user-defined variables values from variable directories. See variable files in Configuration reference.

5.3.5 Repository Configuration

class dnf.repodict.RepoDict
Dictionary mapping repository IDs to the respective dnf.repo.Repo objects. Derived from the standard dict.

add(repo)
Add a Repo to the repodict.

add_new_repo(repoid, conf, baseurl=(), **kwargs)
Initialize new Repo object and add it to the repodict. It requires repoid (string), and dnf.conf.Conf object. Optionally it can be specified baseurl (list), and additionally key/value pairs from kwargs to set additional attribute of the Repo object. Variables in provided values (baseurl or kwargs) will be automatically substituted using conf.substitutions (like $releasever,...). It returns the Repo object.

all()
Return a list of all contained repositories.

See the note at get_matching() for special semantics of the returned object.

enable_debug_repos()
Enable debug repos corresponding to already enabled binary repos.

enable_source_repos()
Enable source repos corresponding to already enabled binary repos.

get_matching(key)
Return a list of repositories which ID matches (possibly globbed) key or an empty list if no matching repository is found.

The returned list acts as a composite, transparently forwarding all method calls on itself to the contained repositories. The following thus disables all matching repos:

```python
#!/usr/bin/python3
import dnf

base = dnf.Base()
base.read_all_repos()
base.fill_sack()

repos = base.repos.get_matching('*-debuginfo')
repos.disable()
```

iter_enabled()
Return an iterator over all enabled repos from the dict.

dnf.repo.repo_id_invalid(repo_id)
Return index of the first invalid character in the repo_id or None if all characters are valid. This function is used to validate the section names in .repo files.
class dnf.repo.Metadata
Represents the metadata files.

**fresh**
Boolean. True if the metadata was loaded from the origin, False if it was loaded from the cache.

class dnf.repo.Repo
Repository object used for metadata download. To configure it properly one has to give it either metalink, mirrorlist or baseurl parameter. This object has attributes corresponding to all configuration options from both “Repo Options” and “Options for both [main] and Repo” sections.

**Important:** Some Repo attributes have non-native Python types. Duck typing works (objects have identical behavior), but isinstance() and type() doesn’t work as expected because of different types. For example excludepkgs and includepkgs return VectorString, which is a SWIG wrapper on top of underlying libdnf C++ code.

id
ID of this repo. This attribute is read-only.

metadata
If load() has been called and succeeded, this contains the relevant Metadata instance.

pkgdir
Directory where packages of a remote repo will be downloaded to. By default it is derived from cachedir in __init__() but can be overridden by assigning to this attribute.

repofile
The path to configuration file of the class.

__init__(name=None, parent_conf=None)
Init repository with ID name and the parent_conf which an instance of dnf.conf.Conf holding main dnf configuration. Repository ID must be a string that can contain ASCII letters, digits, and -_: characters.

add_metadata_type_to_download(metadata_type)
Ask for additional repository metadata type to download. Given metadata_type is appended to the default metadata set when repository is downloaded.

disable()
Disable the repository. Repositories are enabled by default.

dump()
Print repository configuration, including inherited values.

enable()
Enable the repository (the default).

get_http_headers()
Return user defined http headers. Return tuple of strings.

get_metadata_content(metadata_type)
Return contents of the repository’s metadata file of the given metadata type. Contents of compressed files are returned uncompressed.

get_metadata_path(metadata_type)
Return path to the file with downloaded repository metadata of given type.

load()
Load the metadata of this repository. Will try to use local cache if possible and initiate and finish download if not. Returns True if fresh metadata has been downloaded and False if cache was used. Raises dnf.exceptions.RepoError if the repo metadata could not be obtained.
set_http_headers(headers)
    Set new user headers and rewrite existing ones. headers must be an instance of tuple of strings or list of strings.

set_or_append_opt_value(name, value_string, priority=PRIO_RUNTIME).
    For standard repository options, sets the value of the option if the priority is equal to or higher than the current priority. For “append” options, appends the values parsed from value_string to the current list of values. If the first parsed element of the list of values is empty and the priority is equal to or higher than the current priority, the current list is replaced with the new values. If the priority is higher than the current priority, the current priority is increased to the priority. Raises dnf.exceptions.ConfigError if the option with the given name does not exist or value_string contains an invalid value or not allowed value.

set_progress_bar(progress)
    Set the download progress reporting object for this repo during load(). progress must be an instance of dnf.callback.DownloadProgress.

5.3.6 Sack

class dnf.sack.Sack
    The package sack. Contains metadata information about all known packages, installed and available.

    query()
        Return a Query for querying packages contained in this sack.

dnf.sack.rpmdb_sack(base)
    Returns a new instance of sack containing only installed packages (@System repo). Useful to get list of the installed RPMs after transaction.

5.3.7 Queries and Subjects

class dnf.query.Query
    Facilitates lookup of packages in a Sack based on given criteria. Query actually does not consult the information in the Sack until it is evaluated. The evaluation happens either explicitly using run() or by iterating the query, for example:

```
#!/usr/bin/python3
import dnf

base = dnf.Base()
base.fill_sack()

q = base.sack.query()
i = q.installed()
i = i.filter(name='dnf')

packages = list(i)  # i only gets evaluated here
print("Installed dnf package:"
for pkg in packages:
    print(pkg, pkg.reponame)
```

or:
```
#!/usr/bin/python3
import dnf

# (continues on next page)
base = dnf.Base()
base.read_all_repos()
base.fill_sack()

q = base.sack.query()
a = q.available()
a = a.filter(name='dnf')

print("Available dnf packages:")
for pkg in a:  # a only gets evaluated here
    print('{} in repo {}'.format(pkg, pkg.reponame))

Notice that none of the filtering methods mutates the state of the Query but produces a new object instead.

**available**

Returns a new query limiting the original query to the packages available from the repositories.

**difference** *other*

Returns a new query that contains only those results of original query that are not in the results of the other query.

**downgrades**

Returns a new query that limits the result only to packages that can be downgrade candidates to other packages in the current set. Downgrade candidate has the same name, lower EVR and the architecture of the original and the downgrade candidate are suitable for a downgrade. Specifically, the filtering does not take any steps to establish that the downgrade candidate can actually be installed.

**duplicated**

Returns a new query that limits the result only to installed packages of same name and different version. Optional argument exclude accepts a list of package names that will be excluded from result.

**extras**

Returns a new query that limits the result to installed packages that are not present in any repo

**filter** *kwargs*

Returns a new query limiting the original query to the key/value pairs from **kwargs**. Multiple **kwargs** can be passed, the filter then works by applying all of them together (logical AND). Values inside of list or query are cumulative (logical OR).

Allowed keys are:
<table>
<thead>
<tr>
<th>key</th>
<th>value type</th>
<th>value meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>arch</td>
<td>string</td>
<td>match against packages’ architecture</td>
</tr>
<tr>
<td>downgrades</td>
<td>boolean</td>
<td>see <code>downgrades()</code>; Defaults to False.</td>
</tr>
<tr>
<td>empty</td>
<td>boolean</td>
<td>True limits to empty result set. Defaults to False.</td>
</tr>
<tr>
<td>epoch</td>
<td>integer</td>
<td>match against packages’ epoch.</td>
</tr>
<tr>
<td>file</td>
<td>string</td>
<td>match against packages’ files</td>
</tr>
<tr>
<td>latest</td>
<td>integer</td>
<td>limit to all packages of number of versions</td>
</tr>
<tr>
<td>latest_per_arch</td>
<td>integer</td>
<td>see <code>latest()</code></td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>match against packages’ names</td>
</tr>
<tr>
<td>release</td>
<td>string</td>
<td>match against packages’ releases</td>
</tr>
<tr>
<td>reponame</td>
<td>string</td>
<td>match against repositories’ names</td>
</tr>
<tr>
<td>version</td>
<td>string</td>
<td>match against packages’ versions</td>
</tr>
<tr>
<td>pkg</td>
<td>Query</td>
<td>match against packages in query</td>
</tr>
<tr>
<td>pkg*</td>
<td>list</td>
<td>match against packages in list</td>
</tr>
<tr>
<td>provides</td>
<td>string</td>
<td>match against packages’ provides</td>
</tr>
<tr>
<td>provides*</td>
<td>Hawkey.Reldep</td>
<td>match against packages’ provides</td>
</tr>
<tr>
<td>&lt;DEP&gt;</td>
<td>string</td>
<td>match against packages’ &lt;DEP&gt;</td>
</tr>
<tr>
<td>&lt;DEP&gt;*</td>
<td>Hawkey.Reldep</td>
<td>match a reldep against packages’ &lt;DEP&gt;</td>
</tr>
<tr>
<td>&lt;DEP&gt;*</td>
<td>Query</td>
<td>match the result of a query against packages’ &lt;DEP&gt;</td>
</tr>
<tr>
<td>&lt;DEP&gt;*</td>
<td>list(Package)</td>
<td>match the list of Hawkey.Packages against packages’ &lt;DEP&gt;</td>
</tr>
<tr>
<td>sourcerpm</td>
<td>string</td>
<td>match against packages’ source rpm</td>
</tr>
<tr>
<td>upgrades</td>
<td>boolean</td>
<td>see <code>upgrades()</code>; Defaults to False.</td>
</tr>
</tbody>
</table>

<DEP> can be any of: requires, conflicts, obsoletes, enhances, recomments, suggests, supplements

* The key can also accept a list of values with specified type.

The key name can be supplemented with a relation-specifying suffix, separated by __:

<table>
<thead>
<tr>
<th>key suffix</th>
<th>value type</th>
<th>semantics</th>
</tr>
</thead>
<tbody>
<tr>
<td>eq</td>
<td>any</td>
<td>exact match; This is the default if no suffix is specified.</td>
</tr>
<tr>
<td>glob</td>
<td>string</td>
<td>shell-style wildcard match</td>
</tr>
<tr>
<td>gt</td>
<td>integer</td>
<td>the actual value is greater than specified</td>
</tr>
<tr>
<td>gte</td>
<td>integer</td>
<td>the actual value is greater than or equal to specified</td>
</tr>
<tr>
<td>lt</td>
<td>integer</td>
<td>the actual value is less than specified</td>
</tr>
<tr>
<td>lte</td>
<td>integer</td>
<td>the actual value is less than or equal to specified</td>
</tr>
<tr>
<td>neq</td>
<td>any</td>
<td>does not equal</td>
</tr>
<tr>
<td>substr</td>
<td>string</td>
<td>the specified value is contained in the actual value</td>
</tr>
<tr>
<td>eqg</td>
<td>string</td>
<td>exact match or the first higher, used with advisory filters</td>
</tr>
<tr>
<td>upgrade</td>
<td>string</td>
<td>skips advisory resolved by installed packages</td>
</tr>
</tbody>
</table>

For example, the following creates a query that matches all packages containing the string “club” in its name:

```python
q = base.sack.query().filter(name__substr="club")
```

Note that using packages or queries for dependency filtering performs a more advanced resolution than using a string or a reldep. When a package list or a query is used, rich dependencies are resolved in a more precise way than what is possible when a string or a reldep is used.

```python
filterm(**kwargs)
```

Similar to `dnf.query.Query.filter()` but it modifies the query in place.
installed()
Returns a new query that limits the result to the installed packages only.

intersection (other)
Returns a new query where the result contains only packages that are found in both original and other queries.

latest (limit=1)
Returns a new query that limits the result to the highest version of packages per package name and per architecture. In case the limit is a negative number, it excludes the number of latest versions according to limit.

run()
Evaluate the query. Returns a list of matching dnf.package.Package instances.

union (other)
Returns a new query where the results of the other query are added to the results of the original query.

upgrades()
Returns a new query that limits the result only to packages that can be upgrade candidates to at least one package in the current set. Upgrade candidate has the same name, higher EVR and the architectures of the original and the upgrade candidate package are suitable for an upgrade. Specifically, the filtering does not take any steps to establish that the upgrade candidate can actually be installed.

class dnf.subject.Subject
As explained on the DNF man page, users of the CLI are able to select packages for an operation in different formats, leaving seemingly arbitrary parts out of the spec and even using globbing characters. This class implements a common approach to parsing such input and produce a Query listing all packages matching the input or a Selector selecting a single package that best matches the input given a transaction operation.

__init__ (pkg_spec, ignore_case=False)
Initialize the Subject with pkg_spec input string with following semantic. If ignore_case is True ignore the case of characters in pkg_spec.

get_best_query (sack, with_nevra=True, with_provides=True, with_filenames=True, forms=None)
Returns a Query yielding packages matching the given input. The result of the returned query can be an empty set if no package matches. sack is the Sack that the returned query will search. with_nevra enable search by nevra, with_provides indicates whether besides package names also packages’ provides are searched for a match, and with_filenames indicates whether besides package provides also packages’ file provides are searched for a match. forms is a list of pattern forms from ‘hawkey’_. Leaving the parameter to None results in using a reasonable default list of forms.

get_best_selector (sack, forms=None, obsoletes=True, reponame=None)
Returns a Selector that will select a single best-matching package when used in a transaction operation. sack and forms have the same meaning as in get_best_query(). If obsoletes, selector will also contain packages that obsoletes requested packages (default is True). If reponame, the selection of available packages is limited to packages from that repo (default is None).

get_nevra_possibilities (self, forms=None)
Returns generator for every possible nevra. Each possible nevra is represented by NEVRA class (libdnf) that has attributes name, epoch, version, release, arch. forms have the same meaning as in get_best_query().

Example how to use it when it is known that string could be full NEVRA or NEVR:

```
#!/usr/bin/python3
import dnf
import hawkey
```
nevra_string = "dnf-0:4.2.2-2.fc30.noarch"
subject = dnf.subject.Subject(nevra_string)
possible_nevra = subject.get_nevra_possibilities(
    forms=[hawkey.FORM_NEVRA, hawkey.FORM_NEVR])

for i, nevra in enumerate(possible_nevra):
    print("Possibility {} for ", format(i+1, nevra_string))
    print("name: ", format(nevra.name))
    print("epoch: ", format(nevra.epoch))
    print("version: ", format(nevra.version))
    print("release: ", format(nevra.release))
    print("architecture: ", format(nevra.arch))
    print()

5.3.8 Selector

class dnf.selector.Selector
    Specify a target of a transaction operation.
    set()
        Set content of Selector similarly like dnf.query.Query.filter()
    matches()
        Returns packages that represents the content of Selector

5.3.9 Package

class dnf.package.Package
    Represents a unit of software management, typically corresponds to an RPM file.
    arch
        Architecture of the package (string).
    baseurl
        Baseurl of the package (string).
    buildtime
        Seconds since the epoch when the package was built (integer).
    checksum
        Tuple with package checksum and checksum type or None. The checksum is returned only for packages
        from repository. The checksum is not returned for installed package or packages from commandline
        repository. The checksum represents @pkgid value which links primary metadata with other repository
        metadata files.
    conflicts
        Packages that the package conflicts with (list of Hawkey.Reldep).
    debug_name
        The name of the debug-info package (string).
    description
        The description of the package (string).
    downloadsize
        The size of rpm package in bytes (integer).
epoch
   Epoch of the package (integer).

enhances
   Packages that the package enhances (list of Hawkey.Reldep).

ev
   EVR (epoch:version-revision) of the package (string).

files
   Files the package provides (list of strings).

from_repo
   For installed packages returns id of repository from which the package was installed if such information is available in the history database. Otherwise returns an empty string (string).

group
   Group of the package (string).

hdr_chksum
   Tuple with package header checksum and checksum type or None. The checksum is returned only for installed packages.

hdr_end
   Header end index for the package. Returns 0 for not known (integer).

changelogs
   Changelogs for the package (list of dictionaries with “timestamp”, “author” and “text” keys).

installed
   Returns True if the package is installed (boolean).

installtime
   Seconds since the epoch when the package was installed (integer).

installsize
   Space in bytes the package takes on the system after installation (integer).

license
   License of the package (string).

medianr
   Median number for the package (integer).

name
   The name of the package (string).

obsoletes
   Packages that are obsoleted by the package (list of Hawkey.Reldep).

provides
   Package’s provides (list of Hawkey.Reldep).

recommends
   Packages that are recommended by the package (list of Hawkey.Reldep).

release
   Release of the package (string).

reponame
   Id of repository the package belongs to (@System for installed packages) (string).

requires
   Package’s requirements, combined requires_pre and regularRequires (list of Hawkey.Reldep).
requires_pre
   Installed package’s %pre, %post, %preun and %postun requirements (list of Hawkey.Reldep). For not
   installed package returns just %pre and %post requirements.

regular_requires
   Package’s requirements without %pre, %post, %preun and %postun requirements (list of Hawkey.Reldep).

prereq_ignoreinst
   Safe to remove requires_pre requirements of an installed package (list of Hawkey.Reldep).

rpmdbid
   The rpmdb ID for the package (integer).

source_debug_name
   The name of the source debug-info package (string).

source_name
   The name of the source package (string).

sourcerpm
   Full name of the SRPM used to build this package (string).

suggests
   Packages that are suggested by the package (list of Hawkey.Reldep).

summary
   Summary for the package (string).

supplements
   Packages that the package supplements (list of Hawkey.Reldep).

url
   URL for the package (string).

version
   Version of the package (string).

remote_location (schemes=('http', 'ftp', 'file', 'https'))
   The location from where the package can be downloaded from (string). If the information is unavailable it
   returns None. schemes limits result to list of protocols.

5.3.10 Transaction

class dnf.db.group.RPMTransaction
   Instances of this class describe a resolved transaction set. The transaction object can be iterated for the contained
   items.

   The packaging requests from the contained items are later passed to the core package manager (RPM) as they
   are without further dependency resolving. If the set is not fit for an actual transaction (e.g. introduces conflicts,
   has inconsistent dependencies) RPM then by default refuses to proceed.

install_set
   Read-only property which contains set of Packages to be installed.

remove_set
   Read-only property which contains set of Packages to be removed.
5.3.11 Comps, or the Distribution Compose Metadata

class dnf.comps.Comps
An object of this class can merge comps information from arbitrary repositories. It typically is instantiated from
dnf.Base and covers all the available repositories.

The *_by_pattern methods all take a pattern and an optional case_sensitive parameter. The pattern is
matched against names and IDs of objects in the domain (groups, categories, environments), the globbing
characters in pattern retain their usual expanding meaning. If case_sensitive is True, matching is done in
a case-sensitive manner.

categories
List of all contained dnf.comps.Category objects.

environments
List of all contained dnf.comps.Environment objects ordered by display_order tag defined in
comps.xml file.

groups
List of all contained dnf.comps.Group objects ordered by display_order tag defined in comps.xml
file.

category_by_pattern (pattern, case_sensitive=False)
Returns a dnf.comps.Category object matching pattern, or None.

categories_by_pattern (pattern, case_sensitive=False)
Return an iterable of dnf.comps.Category objects matching pattern.

categories_iter ()
Return iterator over all contained dnf.comps.Category objects.

environment_by_pattern (pattern, case_sensitive=False)
Return a dnf.comps.Environment object matching pattern, or None.

environments_by_pattern (pattern, case_sensitive=False)
Return an iterable of dnf.comps.Environment objects matching pattern ordered by display_order
tag defined in comps.xml file.

environments_iter
Return iterator over all contained dnf.comps.Environment objects in order they appear in
comps.xml file.

group_by_pattern (pattern, case_sensitive=False)
Return a dnf.comps.Group object matching pattern, or None.

groups_by_pattern (pattern, case_sensitive=False)
Return an iterable of dnf.comps.Group objects matching pattern ordered by display_order tag defined
in comps.xml file.

groups_iter
Return iterator over all contained dnf.comps.Group objects in order they appear in comps.xml file.

class dnf.comps.Package
Represents comps package data.

Note: Should not be confused with dnf.package.Package which represents a package contained in a
Sack. There is no guarantee whether the comps package has a corresponding real sack package, i.e. there can
be no package of given name in the sack, one such package, or more than one. For this reason two separate
types are introduced.
name
   Name of the package.

option_type
   The type of inclusion of this particular package in its group. Must be one of the inclusion types.

class dnf.comps.Category

   id
      Unique identifier of the category.

   name
      Name of the category.

   ui_name
      The name of the category translated to the language given by the current locale.

   ui_description
      The description of the category translated to the language given by the current locale.

class dnf.comps.Environment
   Has the same set of attributes as dnf.comps.Category.

class dnf.comps.Group
   Has the same set of attributes as dnf.comps.Category.

   packages_iter()
      Return iterator over all packages belonging in this group.

Following types of inclusions of objects in their parent objects are defined:

dnf.comps.CONDITIONAL

dnf.comps.DEFAULT

dnf.comps.MANDATORY

dnf.comps.OPTIONAL

5.3.12 Plugin Interface

DNF plugin can be any Python class fulfilling the following criteria:

1. it derives from dnf.Plugin,
2. it is made available in a Python module stored in one of the Conf.pluginpath,
3. provides its own name and __init__().

When DNF CLI runs it loads the plugins found in the paths during the CLI’s initialization.

class dnf.Plugin
   The base class all DNF plugins must derive from.

   name
      The plugin must set this class variable to a string identifying the plugin. The string can only contain alphanumeric characters and underscores.

   static read_config(conf)
      Read plugin’s configuration into a ConfigParser compatible instance. conf is a Conf instance used to look up the plugin configuration directory.
__init__(base, cli)
The plugin must override this. Called immediately after all the plugins are loaded. base is an instance of
dnf.Base. cli is an instance of dnf.cli.Cli but can also be None in case DNF is running without a
CLI (e.g. from an extension).

pre_config()
This hook is called before configuring the repos.

config()
This hook is called immediately after the CLI/extension is finished configuring DNF. The plugin can use
this to tweak the global configuration or the repository configuration.

resolved()
This hook is called immediately after the CLI has finished resolving a transaction. The plugin can use this
to inspect the resolved but not yet executed Base.transaction.

sack()
This hook is called immediately after Base.sack is initialized with data from all the enabled repos.

pre_transaction()
This hook is called just before transaction execution. This means after a successful transaction test. RP-
MDB is locked during that time.

transaction()
This hook is called immediately after a successful transaction. Plugins that were removed or obsoleted by
the transaction will not run the transaction hook.

register_command(command_class)
A class decorator for automatic command registration.

Example of a plugin that provides a hello-world dnf command (the file must be placed in one of the pluginpath
directories:

```python
import dnf

@dnf.plugin.register_command
class HelloWorldCommand(dnf.cli.Command):
    aliases = ('hello-world',)
    summary = 'The example command'

    def run(self):
        print('Hello world!')

To run the command:

$ dnf hello-world
Hello world!
```

You may want to see the comparison with yum plugin hook API.

### 5.3.13 Progress Reporting with Callbacks

class dnf.callback.Payload
Represents one item (file) from the download batch.

__str__()
Provide concise, human-readable representation of this Payload.
download_size
Total size of this Payload when transferred (e.g. over network).

class dnf.callback.DownloadProgress
Base class providing callbacks to receive information about an ongoing download.

start (total_files, total_size, total_drpms=0)
Report start of a download batch. total_files is the total number of payloads in the batch. total_size is the total number of bytes to be downloaded. total_drpms is the total number of drpms payloads in the batch.

progress (payload, done)
Report ongoing progress on the given payload. done is the number of bytes already downloaded from payload.

eend (payload, status, msg)
Report finished download of a payload, Payload instance. status is a constant with the following meaning:

<table>
<thead>
<tr>
<th>status value</th>
<th>meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>STATUS_OK</td>
<td>Download finished successfully.</td>
</tr>
<tr>
<td>STATUS_DRPM</td>
<td>DRPM rebuilt successfully.</td>
</tr>
<tr>
<td>STATUS_ALREADY_EXISTS</td>
<td>Download skipped because the local file already exists.</td>
</tr>
<tr>
<td>STATUS_MIRROR</td>
<td>Download failed on the current mirror, will try to use next mirror in the list.</td>
</tr>
<tr>
<td>STATUS_FAILED</td>
<td>Download failed because of another error.</td>
</tr>
</tbody>
</table>

msg is an optional string error message further explaining the status.

class dnf.callback.TransactionProgress
Base class providing callbacks to receive information about an ongoing transaction.

error (message)
Report an error that occurred during the transaction. message is a string which describes the error.

progress (package, action, ti_done, ti_total, ts_done, ts_total)
Report ongoing progress on the given transaction item. package is the dnf.package.Package being processed and action is a constant with the following meaning:
<table>
<thead>
<tr>
<th>action</th>
<th>meaning</th>
<th>Appearance*</th>
</tr>
</thead>
<tbody>
<tr>
<td>PKG_CLEANUP</td>
<td>package cleanup is being performed.</td>
<td>3</td>
</tr>
<tr>
<td>PKG_DOWNGRADE</td>
<td>package is being installed as a downgrade.</td>
<td>2</td>
</tr>
<tr>
<td>PKG_DOWNGRADED</td>
<td>installed package is being downgraded.</td>
<td>2</td>
</tr>
<tr>
<td>PKG_INSTALL</td>
<td>package is being installed.</td>
<td>2</td>
</tr>
<tr>
<td>PKG_OBSOLETE</td>
<td>package is obsoleting another package.</td>
<td>2</td>
</tr>
<tr>
<td>PKG_OBSOLETED</td>
<td>installed package is being obsoleted.</td>
<td>2</td>
</tr>
<tr>
<td>PKG_REINSTALL</td>
<td>package is installed as a reinstall.</td>
<td>2</td>
</tr>
<tr>
<td>PKG_REINSTALLED</td>
<td>installed package is being reinstalled.</td>
<td>2</td>
</tr>
<tr>
<td>PKG_REMOVE</td>
<td>package is being removed.</td>
<td>2</td>
</tr>
<tr>
<td>PKG_UPGRADE</td>
<td>package is installed as an upgrade.</td>
<td>2</td>
</tr>
<tr>
<td>PKG_UPGRADED</td>
<td>installed package is being upgraded.</td>
<td>2</td>
</tr>
<tr>
<td>PKG_VERIFY</td>
<td>package is being verified.</td>
<td>5</td>
</tr>
<tr>
<td>PKG_SCRIPTLET</td>
<td>package scriptlet is being performed.</td>
<td>Anytime</td>
</tr>
<tr>
<td>TRANS_PREPARATION</td>
<td>transaction is being prepared.</td>
<td>1</td>
</tr>
<tr>
<td>TRANS_POST</td>
<td>The post-trans phase started. In this case, all the other arguments are None.</td>
<td>4</td>
</tr>
</tbody>
</table>

*This is order in which state of transaction which callback action can appear. Only PKG_SCRIPTLET can appear anytime during transaction even before transaction starts.

$ti\_done$ is the number of processed bytes of the transaction item, $ti\_total$ is the total number of bytes of the transaction item, $ts\_done$ is the number of actions processed in the whole transaction and $ts\_total$ is the total number of actions in the whole transaction.

### 5.3.14 RPM Interface

**dnf.rpm.detect_releasever** *(installroot)*

Return the release name of the distribution of the tree rooted at *installroot*. The function uses information from RPMDB found under the tree.

Returns *None* if the information can not be determined (perhaps because the tree has no RPMDB).

**dnf.rpm.basearch** *(arch)*

Return base architecture of the processor based on *arch* type given. E.g. when *arch* i686 is given then the returned value will be i386.

### 5.3.15 Command Line Interface Hooks

**dnf.cli** is a part of DNF that contains code handling the command line tasks for DNF, like for instance **dnf** install emacs, and outputs the results to the terminal. It is usually of no interest for DNF extension applications, but some parts of it described here can be used by the Plugin Interface to hook up custom commands.

When packaging your custom command, we recommend you to define a virtual provide in the form of **Provides**: **dnf-command(<alias>)** in the spec file. See the virtual provides usage for the details.

**exception** **dnf.cli.CliError**

Signals a CLI-specific problem (reading configuration, parsing user input, etc.). Derives from **dnf.exceptions.Error**.

**class** **dnf.cli.demand.DemandSheet**

Instances are used to track requests of commands and plugins about how CLI should set up/handle other parts.
of CLI processing that are not under the command’s/plugin’s direct control. The boolean attributes of the sheet can not be reset once explicitly set, doing so raises an AttributeError.

**allow_erasing**

If True, the dependency solver is allowed to look for solutions that include removing other packages while looking to fulfill the current packaging requests. Defaults to False. Also see `dnf.Base.resolve()`.

**available_repos**

If True, during sack creation (sack_activation), download and load into the sack the available repositories. Defaults to False.

**resolving**

If True, at a place where the CLI would otherwise successfully exit, resolve the transaction for any outstanding packaging requests before exiting. Defaults to False.

**root_user**

True informs the CLI that the command can only succeed if the process’s effective user id is 0, i.e. root. Defaults to False.

**sack_activation**

If True, demand that the CLI sets up the Sack before the command’s run() method is executed. Defaults to False.

Depending on other demands and the user’s configuration, this might or might not correctly trigger metadata download for the available repositories.

**load_system_repo**

If True, DNF will load information about installed packages from the local RPMDB into the sack during `dnf.Base.fill_sack()`. Defaults to True.

**cacheonly**

When True, DNF will run entirely from the system cache (equivalent of -C command line option). Defaults to False.

**fresh_metadata**

False means that (even expired) cached repository metadata will be used. When True, the expired repository metadata caches are synchronized with server. Defaults to True.

**freshest_metadata**

If True, metadata caches for all enabled repositories are forcibly expired before the sack is activated. Defaults to False.

**changelogs**

If True, also the repository metadata containing changelogs for packages will be downloaded. Defaults to False.

**success_exit_status**

The return status of the DNF command on success. Defaults to 0.

**transaction_display**

An additional instance of a subclass of `dnf.callback.TransactionProgress` used to report information about an ongoing transaction. Defaults to None.

**class** dnf.cli.Command

Base class of every DNF command.

**aliases**

Sequence of strings naming the command from the command line. Must be a class variable. The list has to contain at least one string, the first string in the list is considered the canonical name. A command name can be contain only letters and dashes providing the name doesn’t start with a dash.
base
   The `dnf.Base` instance to use with this command.

cli
   The `dnf.cli.Cli` instance to use with this command.

summary
   One line summary for the command as displayed by the CLI help.

__init__(cli)
   Command constructor which can be overridden. The constructor is called during CLI configure phase
   when one of the command’s aliases is parsed from `dnf` commandline. `cli` is an instance of `dnf.cli.Cli`.

pre_configure()
   Perform any pre-configuration on the command itself and on the CLI. Typically, the command implements
   this call to set up releasever or enable/disable repository. This method is called before configuration of
   repos.

configure()
   Perform any configuration on the command itself and on the CLI. Typically, the command implements this
call to set up any demands, tweak the global configuration or the repository configuration. This method
   is called immediately after the CLI/extension is finished configuring DNF.

run()
   Run the command. This method is invoked by the CLI when this command is executed. Should raise
   `dnf.exceptions.Error` with a proper message if the command fails. Otherwise should return `None`.
   Custom commands typically override this method and put their main work code here.

class dnf.cli.Cli
   Manages the CLI, including reading configuration, parsing the command line and running commands.

demands
   An instance of `DemandSheet`, exposed to allow custom commands and plugins influence how the CLI
   will operate.

register_command(command_cls):
   Register new command. `command_cls` is a subclass of `Command`.

redirect_logger(self, stdout=None, stderr=None):
   Change minimal logger level for terminal output to stdout and stderr according to specific command re-
   quirements. For stdout and stderr use `logging.INFO`, `logging.WARN`, etc.

5.3.16 Modularity Interface

class dnf.module.module_base.ModuleBase
   Basic class for handling modules.

   dnf.module.module_base.__init__(base)
      Initialize `dnf.module.module_base.ModuleBase` object. `base` is an instance of the `dnf.Base` class.

   dnf.module.module_base.enable(module_specs)
      Mark module streams matching the `module_specs` list and also all required modular dependencies
      for enabling. For specs that do not specify the stream, the default stream is used. In case that the
      module has only one stream available, this stream is used regardless of whether it is the default or
      not. Note that only one stream of any given module can be enabled on a system. The method raises
      `dnf.exceptions.MarkingErrors` in case of errors.
Example:

```python
#!/usr/bin/python3
import dnf

base = dnf.Base()
base.read_all_repos()
base.fill_sack()

module_base = dnf.module.module_base.ModuleBase(base)
module_base.enable(['nodejs:11'])

base.do_transaction()
```

dnf.module.module_base.disable(module_specs)

Mark modules matching the module_specs list for disabling. Only the name part of the module specification is relevant. Stream, version, context, arch and profile parts are ignored (if given). All streams of the module will be disabled and all installed profiles will be removed. Packages previously installed from these modules will remain installed on the system. The method raises `dnf.exceptions.MarkingErrors` in case of errors.

Example:

```python
#!/usr/bin/python3
import dnf

base = dnf.Base()
base.read_all_repos()
base.fill_sack()

module_base = dnf.module.module_base.ModuleBase(base)
module_base.disable(['nodejs'])

base.do_transaction()
```

dnf.module.module_base.reset(module_specs)

Mark module for resetting so that it will no longer be enabled or disabled. All installed profiles of streams that have been reset will be removed. The method raises `dnf.exceptions.MarkingErrors` in case of errors.

dnf.module.module_base.install(module_specs, strict=True)

Mark module profiles matching module_specs for installation and enable all required streams. If the stream or profile part of specification is not specified, the defaults are chosen. All packages of installed profiles are also marked for installation. If strict is set to False, the installation skips modules with dependency solving problems. The method raises `dnf.exceptions.MarkingErrors` in case of errors.

Example:

```python
#!/usr/bin/python3
import dnf

base = dnf.Base()
base.read_all_repos()
base.fill_sack()

module_base = dnf.module.module_base.ModuleBase(base)
module_base.install(['nodejs:11/minimal'])
```
(continues on next page)
dnf Documentation, Release stable

(continued from previous page)

```python
def base.resolve():
def base.download_packages(base.transaction.install_set):
def base.do_transaction():

dnf.module.module_base.remove(module_specs)
    Mark module profiles matching module_spec for removal. All packages installed from removed
    profiles (unless they are required by other profiles or user-installed packages) are also marked for
    removal.

dnf.module.module_base.upgrade(module_specs)
    Mark packages of module streams (or profiles) matching module_spec for upgrade.

dnf.module.module_base.get_modules(module_spec)
    Get information about modules matching module_spec. Returns tuple (module_packages, nsvecap),
    where nsvecap is a hawkey.NSVCAP object parsed from module_spec and module_packages is a
    tuple of libdnf.module.ModulePackage objects matching this nsvecap.

Example:

```python
#!/usr/bin/python3
import dnf

base = dnf.Base()
base.read_all_repos()
base.fill_sack()

module_base = dnf.module.module_base.ModuleBase(base)
module_packages, nsvecap = module_base.get_modules('nodejs:11/minimal')

print("Parsed NSVCAP:")
print("name:", nsvecap.name)
print("stream:", nsvecap.stream)
print("version:", nsvecap.version)
print("context:", nsvecap.context)
print("arch:", nsvecap.arch)
print("profile:", nsvecap.profile)

print("Matching modules:")
for mpkg in module_packages:
    print(mpkg.getFullIdentifier())
```

class libdnf.module.ModulePackage
This class represents a record identified by NSVCA from the repository modular metadata. See also https://github.com/fedora-modularity/libmodulemd/blob/main/spec.v2.yaml.

dnf.module.module_base.getName()
    Return the name of the module.

dnf.module.module_base.getStream()
    Return the stream of the module.

dnf.module.module_base.getVersion()
    Return the version of the module as a string.

dnf.module.module_base.getVersionNum()
    Return the version of the module as a number.

5.3. Contents
83
dnf.module.module_base.getContext()  
   Return the context of the module.

dnf.module.module_base.getArch()  
   Return the architecture of the module.

dnf.module.module_base.getNamestream()  
   Return string in the form of ‘name:stream’ for the module.

dnf.module.module_base.getNameStreamVersion()  
   Return string in the form of ‘name:stream:version’ for the module.

dnf.module.module_base.getFullIdentifier()  
   Return string in the form of ‘name:stream:version:context:architecture’ for the module.

dnf.module.module_base.getProfiles(name=None)  
   Return tuple of libdnf.module.ModuleProfile instances representing each of the individual profiles of the module. If the name is given, only profiles matching the name pattern are returned.

dnf.module.module_base.getSummary()  
   Return the summary of the module.

dnf.module.module_base.getDescription()  
   Return the description of the module.

dnf.module.module_base.getRepoID()  
   Return the identifier of source repository of the module.

dnf.module.module_base.getArtifacts()  
   Return tuple of the artifacts of the module.

dnf.module.module_base.getModuleDependencies()  
   Return tuple of libdnf.module.ModuleDependencies objects representing modular dependencies of the module.

dnf.module.module_base.getYaml()  
   Return repomd yaml representing the module.

class libdnf.module.ModuleProfile

ggetName()  
   Return the name of the profile.

ggetDescription()  
   Return the description of the profile.

ggetContent()  
   Return tuple of package names to be installed with this profile.

class libdnf.module.ModuleDependencies

ggetRequires()  
   Return tuple of MapStringVectorString objects. These objects behave like standard python dictionaries and represent individual dependencies of the given module. Keys are names of required modules, values are tuples of required streams specifications.

class libdnf.module.ModulePackageContainer
   This class is under development and should be considered unstable at the moment.

    • Why are dnf check-update packages not marked for upgrade in the following dnf upgrade
    • Why do I get different results with dnf upgrade vs yum update?
    • Is it possible to force DNF to get the latest metadata on dnf upgrade?
    • How do I disable automatic metadata synchronization service?
    • Shouldn’t DNF exit soon from certain commands if it is not run under root?
  – Using DNF in Fedora
    • For my stable Fedora release, can I install the rawhide packages for testing purposes?
6.1 General Questions

6.1.1 What does DNF stand for?

Dandified YUM.

6.1.2 Can I have DNF and YUM installed side by side?

Yes, you can. And this setup is tested by many.

There is one restriction: DNF and YUM keep additional data about each installed package and every performed transaction. This data is currently not shared between the two managers so if the admin installs half of the packages with DNF and the other half with YUM then each program can not benefit from the information held by the other one. The practical bottom line is that commands like autoremove can not take a completely informed decision and thus have to “play it safe” and remove only a subset of dependencies they would be able to otherwise. Similar situation exists with groups.

To transfer transaction additional data from yum to DNF, run:

```
dnf install python-dnf-plugins-extras-migrate && dnf-2 migrate
```

6.1.3 Is there a compatibility layer for YUM?

For the CLI, yes. Just install dnf-yum which supplies our own /usr/bin/yum. Note two things: all the differences between the two package managers still apply and this does not provide “yum” in terms of package dependencies (it conflicts with the YUM package though).

6.1.4 What to do with packages that DNF refuses to remove because their %pre or %preun scripts are failing?

If this happens, it is a packaging error and consider reporting the failure to the package’s maintainer.

You can usually remove such package with rpm:

```
rpm -e <package-version> --noscripts
```

6.1.5 Why are dnf check-update packages not marked for upgrade in the following dnf upgrade

Sometimes one can see that a newer version of a package is available in the repos:

```
$ dnf check-update
libocsync0.x86_64 0.91.4-2.1    devel_repo
owncloud-client.x86_64 1.5.0-18.1    devel_repo
```

Yet the immediately following dnf upgrade does not offer them for upgrade:

```
$ dnf upgrade
Resolving dependencies
--> Starting dependency resolution
```

(continues on next page)
It might seem odd but in fact this can happen quite easily: what the first command does is only check whether there are some available packages with the same name as an installed package but with a higher version. Those are considered upgrade candidates by `check-update`, but no actual dependency resolving takes place there. That only happens during `dnf upgrade` and if the resolving procedure then discovers that some of the packages do not have their dependencies ready yet, then they are not offered in the upgrade. To see the precise reason why it was not possible to do the upgrade in this case, use:

```
$ dnf upgrade --best
```

In DNF version 1.1 and above, you can see the skipped packages in the special transaction summary section. In order to pull these packages into transaction one has to remove conflicting packages, to do that execute:

```
$ dnf upgrade --best --allowerasing
```

### 6.1.6 Why do I get different results with `dnf upgrade` vs `yum update`?

We get this reported as a bug quite often, but it usually is not. One reason to see this is that DNF does not list update candidates as it explores them. More frequently however the reporter means actual difference in the proposed transaction. This is most often because the metadata the two packagers are working with were taken at a different time (DNF has a notoriously looser schedule on metadata updates to save time and bandwidth), and sometimes also because the depsolvers inside are designed to take a different course of action when encountering some specific update scenario.

The bottom line is: unless a real update problem occurs (i.e. DNF refuses to update a package that YUM updates) with the same set of metadata, this is not an issue.

### 6.1.7 Is it possible to force DNF to get the latest metadata on `dnf upgrade`?

Yes, clear the cache first:

```
$ dnf clean metadata
$ dnf upgrade
```

or by one command line simply put:

```
$ dnf upgrade --refresh
```

An alternative is to shorten the default expiry time of repos, for that edit `/etc/dnf/dnf.conf` and set:

```
metadata_expire=0
```

Of course, some repos might use a custom `metadata_expire` value, you’ll currently have to change these manually too.

If you’re the kind of the user who always wants the freshest metadata possible, you’ll probably want to disable the automatic MD updates.
6.1.8 How do I disable automatic metadata synchronization service?

Several ways to do that. The DNF way is to add the following to `/etc/dnf/dnf.conf`:

```
metadata_timer_sync=0
```

6.1.9 Shouldn't DNF exit soon from certain commands if it is not run under root?

No, there can be systems and scenarios that allow other users than root to successfully perform `dnf install` and similar and it would be impractical to stop these from functioning by the UID check. Alternatively, the practice of checking filesystem permissions instead of the effective UID could lead to false positives since there is plenty of time between DNF startup and the possible transaction start when permissions can be changed by a different process.

6.2 Using DNF in Fedora

6.2.1 For my stable Fedora release, can I install the rawhide packages for testing purposes?

Yes, in two steps: first install the necessary `.repo` files:

```
dnf install fedora-repos-rawhide
```

Then, when you want to include the packages from the rawhide repo, execute a DNF command with Rawhide enabled:

```
dnf --enablerepo=rawhide upgrade rpm
```

**Note:** Installing rawhide packages onto a stable Fedora release system is generally discouraged as it leads to less tested combinations of installed packages. Please consider this step carefully.
Modularity is a new way of building, organizing, and delivering packages. For more details see: https://docs.pagure.org/modularity/

### 7.1 Definitions

**modulemd** Every repository can contain modules metadata with modulemd documents. These documents hold metadata about modules such as Name, Stream, or list of packages.

**(non-modular) package** Package that doesn’t belong to a module.

**modular package** Package that belongs to a module. It is listed in modulemd under the artifacts section. Modular packages can be also identified by having %{modularitylabel} RPM header set.

**(module) stream** Stream is a collection of packages, a virtual repository. It is identified with Name and Stream from modulemd separated with colon, for example “postgresql:9.6”.

Module streams can be active or inactive. active means the RPM packages from this stream are included in the set of available packages. Packages from inactive streams are filtered out. Streams are active either if marked as default or if they are explicitly enabled by a user action. Streams that satisfy dependencies of default or enabled streams are also considered active. Only one stream of a particular module can be active at a given point in time.

### 7.2 Package filtering

Without modules, packages with the highest version are used by default.

Module streams can distribute packages with lower versions than available in the repositories available to the operating system. To make such packages available for installs and upgrades, the non-modular packages are filtered out when their name or provide matches against a modular package name from any enabled, default, or dependent stream. Modular source packages will not cause non-modular binary packages to be filtered out.
7.2.1 Demodularized rpms

Contains names of RPMs excluded from package filtering for particular module stream. When defined in the latest active module, non-modular RPMs with the same name or provide which were previously filtered out will reappear.

7.3 Hotfix repositories

In special cases, a user wants to cherry-pick individual packages provided outside module streams and make them available along with packages from the active streams. Under normal circumstances, such packages are filtered out or rejected from getting on the system by Fail-safe mechanisms. To make the system use packages from a repository regardless of their modularity, specify module_hotfixes=true in the .repo file. This protects the repository from package filtering.

Please note the hotfix packages do not override module packages, they only become part of available package set. It’s the package Epoch, Version and Release what determines if the package is the latest.

7.4 Fail-safe mechanisms

7.4.1 Repositories with module metadata are unavailable

When a repository with module metadata is unavailable, package filtering must keep working. Non-modular RPMs must remain unavailable and must never get on the system.

This happens when:

- user disables a repository via --disablerepo or uses --repoid
- user removes a .repo file from disk
- repository is not available and has skip_if_unavailable=true

DNF keeps copies of the latest modulemd for every active stream and uses them if there’s no modulemd available for the stream. This keeps package filtering working correctly.

The copies are made any time a transaction is resolved and started. That includes RPM transactions as well as any dnf module <enable|disable|reset> operations.

When the fail-safe data is used, dnf show such modules as part of @modulefailsafe repository.

7.4.2 Orphaned modular packages

All packages that are built as a part of a module have %{modularitylabel} RPM header set. If such package becomes part of RPM transaction and cannot be associated with any available modulemd, DNF prevents from getting it on the system (package is available, but cannot be installed, upgraded, etc.). Packages from Hotfix repositories or Commandline repository are not affected by Fail-safe mechanisms.
The stored transaction format is considered unstable and may change in an incompatible way at any time. It will work if the same version of dnf is used to store and replay (or between versions as long as it stays the same).

### 8.1 Top-level Object

**version**  
Type: string  
The version of the stored transaction format, in the form MAJOR.MINOR.  
MAJOR version denotes backwards incompatible changes (old dnf won’t work with new transaction JSON).  
MINOR version denotes extending the format without breaking backwards compatibility (old dnf can work with new transaction JSON).

**rpms**  
Type: an array of *rpm* objects  
A list of RPM packages in the transaction.

**groups**  
Type: an array of *group* objects  
A list of groups in the transaction.

**environments**  
Type: an array of *group* objects  
A list of environment groups in the transaction.

### 8.2 rpm Object

**action**  
Type: string  
Possible values: Downgrade, Downgraded, Install, Obsoleted, Reason Change, Reinstall, Reinstalled, Removed, Upgrade, Upgraded  
The action performed on the package in the transaction.
**nevra** Type: string

NEVRA (name-epoch:version-release.arch) of the package.

**reason** Type: string

Possible values: dependency, clean, group, unknown, user, weak-dependency

The reason why the package was pulled into the transaction.

**repo_id** Type: string

The id of the repository this package is coming from. Note repository ids are defined in the local repository configuration and may differ between systems.

### 8.3 group Object

**action** Type: string

Possible values: Install, Upgrade, Removed

The action performed on the group in the transaction.

**id** Type: string

The id of the group.

**package_types** Type: string

Possible values: conditional, default, mandatory, optional

The types of packages in the group that will be installed. Valid only for the Install action.

**packages** Type: an array of group-package objects

The packages belonging to the group in the transaction.

### 8.4 environment Object

**action** Type: string

Possible values: Install, Upgrade, Removed

The action performed on the environment group in the transaction.

**id** Type: string

The id of the environment group.

**package_types** Type: string

Possible values: conditional, default, mandatory, optional

The types of packages in the environment group that will be installed. Valid only for the Install action.

**group** Type: an array of environment-group objects

The groups belonging to the environment in the transaction.
8.5  group-package Object

installed  Type: boolean

Whether the package is considered installed as part of the group.

name  Type: string

The name of the package.

package_type  Type: string

Possible values: conditional, default, mandatory, optional

The type of the package in the group.

8.6  environment-group Object

group_type  Type: string

Possible values: mandatory, optional

The type of the group in the environment.

id  Type: string

The id of the group.

installed  Type: boolean

Whether the group is considered installed as part of the environment.
9.1 4.10.0 Release Notes

- New features: - Add support for autodetecting packages to be excluded from being installed as weak dependencies (RhBug:1699672) - Add support for excluding packages to be installed as weak dependencies (RhBug:1699672) - Add fail_fast parameter to download_payloads methods for use in reposync
- Bug fixes: - Acquire all relevant locks during “dnf clean” - API: Raise CompsError when group/env not found in install_group and install_environment (RhBug:1947958)

Bugs fixed in 4.10.0:
- :rhbug:`1699672`
- :rhbug:`1947958`

9.2 4.9.0 Release Notes

- New features: - [API] Add method “set_or_append_opt_value” to BaseConfig (RhBug:1967925) - Add aliases for commands: info, updateinfo, provides (RhBug:1938333) - Add report about demodularized rpms into module info (RhBug:1805260)
- Bug fixes: - Remove DNSSEC errors on COPR group email keys - Documentation improvements - bugs: 1938352, 1993899, 1963704

Bugs fixed in 4.9.0:
- :rhbug:`1993899`
- :rhbug:`1805260`
- :rhbug:`1938352`
- :rhbug:`1967925`
- :rhbug:`1963704`
9.3 4.8.0 Release Notes

- Do not assume that a remote rpm is complete if present
- Use positive percentage for “Failed delta RPMs” message
- Remove redundant new line in Groups output
- Format empty group names outputs to <name-unset>
- [doc] Document default colors
- Use rpmkeys alone to verify signature
- Bug fixes: - Bugs fixed (RhBug:1946975,1955309) - Add dnf.error message to explain rpm.error traceback when package not found after resolving a transaction (RhBug:1815327,1887293,1909845)

Bugs fixed in 4.8.0:
- :rhbug:`1955309`
- :rhbug:`1950229`
- :rhbug:`1887293`
- :rhbug:`1946975`

9.4 4.7.0 Release Notes

- Improve repo config path ordering to fix a comps merging issue (RhBug:1928181)
- Keep reason when package is removed (RhBug:1921063)
- Improve mechanism for application of security filters (RhBug:1918475)
- [doc] Add description for new API
- [API] Add new method for reset of security filters
- [doc] Improve documentation for Hotfix repositories
- [doc] fix: “makecache” command downloads only enabled repositories
- Use libdnf.utils.checksum_{check,value}
- [doc] Add info that maximum parallel downloads is 20
- Increase loglevel in case of invalid config options
- [doc] installonly_limit documentation follows behavior
- Prevent traceback (catch ValueError) if pkg is from cmdline
- Add documentation for config option sslverifystatus (RhBug:1814383)
- Security fixes: - Check for specific key string when verifying signatures (RhBug:1915990) - Use rpmkeys binary to verify package signature (RhBug:1915990)
- Bug fixes: - Bugs fixed (RhBug:1916783) - Preserve file mode during log rotation (RhBug:1910084)

Bugs fixed in 4.7.0:
9.5 4.6.1 Release Notes

- Fix recreate script
- Add unit test for fill_sack_from_repos_in_cache (RhBug:1865803)
- Add docs and examples for fill_sack_from_repos_in_cache (RhBug:1865803)
- [spec] remove python2 support
- Remove problematic language
- The noroot plugin no longer exists, remove mention
- Run tests for fill_sack_from_repos_in_cache in installroot (RhBug:1865803)
- expand history to full term size when output is redirected (RhBug:1852577) (RhBug:1852577,1906970)
- [doc] Fix: “sslcacert” contains path to the file
- [doc] Added proxy ssl configuration options, increase libdnf require
- Set persistdir and substitutions for fill_sack_from_repos_in_cache tests (RhBug:1865803)
- Update documentation for module_obsoletes and module_stream_switch
- print additional information when verifying GPG key using DNS
- Bug fixes: - Bugs fixed (RhBug:1897573) - Remove hardcoded logfile permissions (RhBug:1910084) - Enhanced detection of plugins removed in transaction (RhBug:1929163)

Bugs fixed in 4.6.1:
- :rhbug:`1852577`
- :rhbug:`1910084`
- :rhbug:`1897573`
- :rhbug:`1929163`
- :rhbug:`1865803`
- :rhbug:`1906970`

9.6 4.6.0 Release Notes

- Log scriptlets output also for API users (RhBug:1847340)
- Fix module remove --all when no match spec (RhBug:1904490)
- yum.misc.decompress() to handle uncompressed files (RhBug:1895059)
- Make an error message more informative (RhBug:1814831)
- Add deprecation notice to help messages of deplist
- Remove Base._history_undo_operations() as it was replaced with transaction_sr code
- cli/output: Return number of listed packages from listPkgs()
- Clean up history command error handling
- [doc] Describe install with just a name and obsoletes (RhBug:1902279)
- Add api function fill_sack_from_repos_in_cache to allow loading a repo cache with repomd and (solv file or primary xml) only (RhBug:1865803)
- Packages installed/removed via DNF API are logged into dnf.log (RhBug:1855158)
- Support comps groups in history redo (RhBug:1657123,1809565,1809639)
- Support comps groups in history rollback (RhBug:1657123,1809565,1809639)
- Support comps groups in history undo (RhBug:1657123,1809565,1809639)
- New optional parameter for filter_modules enables following modular obsoletes based on a config option module_obsoletes
- Add get_header() method to the Package class (RhBug:1876606)
- Fix documentation of globs not supporting curly brackets (RhBug:1913418)
- New features: - Add api function fill_sack_from_repos_in_cache to allow loading a repo cache with repomd and (solv file or primary xml) only (RhBug:1865803) - Packages installed/removed via DNF API are logged into dnf.log (RhBug:1855158) - Support comps groups in history redo (RhBug:1657123,1809565,1809639) - Support comps groups in history rollback (RhBug:1657123,1809565,1809639) - Support comps groups in history undo (RhBug:1657123,1809565,1809639) - New optional parameter for filter_modules enables following modular obsoletes based on a config option module_obsoletes - Add get_header() method to the Package class (RhBug:1876606)
- Bug fixes: - Fix documentation of globs not supporting curly brackets (RhBug:1913418)

Bugs fixed in 4.6.0:
- :rhbug:'1657123'
- :rhbug:'1809639'
- :rhbug:'1913418'
- :rhbug:'1865803'
- :rhbug:'1904490'
- :rhbug:'1847340'
- :rhbug:'1814831'
- :rhbug:'1895059'
- :rhbug:'1855158'
- :rhbug:'1873146'
- :rhbug:'1809565'
- :rhbug:'1876606'
9.7 4.5.2 Release Notes

• Change behaviour of Package().from_repo

Bugs fixed in 4.5.2:

9.8 4.5.1 Release Notes

• Add a get_current() method to SwdbInterface
• Add from_repo attribute for Package class (RhBug:1898968,1879168)
• Correct description of Package().reponame attribute
• Add unittest for new API
• Make rotated log file (mode, owner, group) match previous log settings (RhBug:1894344)
• [doc] Improve description of modular filtering
• [doc] add documentation for from_repo
• [doc] deprecated alias for dnf repoquery –deplist <deplist_option-label>
• New features: - New config option module_allow_stream_switch allows switching enabled streams

Bugs fixed in 4.5.1:

• :rhbug:'1894344`
• :rhbug:'1898548`
• :rhbug:'1879168`
• :rhbug:'1898968`

9.9 4.4.2 Release Notes

• spec: Fix building with new cmake macros (backport from downstream)
• Warn about key retrieval over http:
• Fix –setopt=cachedir writing outside of installroot
• Add vendor to dnf API (RhBug:1876561)
• Add allow_vendor_change option (RhBug:1788371) (RhBug:1788371)

Bugs fixed in 4.4.2:

• :rhbug:'1876561`
• :rhbug:'1788371`

9.10 4.4.0 Release Notes

• Handle empty comps group name (RhBug:1826198)
• Remove dead history info code (RhBug:1845800)
• Improve command emmitter in dnf-automatic
• Enhance –querytags and –qf help output
• [history] add option –reverse to history list (RhBug:1846692)
• Add logfilelevel configuration (RhBug:1802074)
• Don’t turn off stdout/stderr logging longer than necessary (RhBug:1843280)
• Mention the date/time that updates were applied
• [doc] Enhance repo variables documentation (RhBug:1848161,1848615)
• Add librepo logger for handling messages from librepo (RhBug:1816573)
• [doc] Add package-name-spec to the list of possible specs
• [doc] Do not use <package-nevr-spec>
• [doc] Add section to explain -n, -na and -nevra suffixes
• Add alias ‘ls’ for list command
• README: Reference Fedora Weblate instead of Zanata
• remove log_lock.pid after reboot(Rhbug:1863006)
• comps: Raise CompsError when removing a non-existent group
• Add methods for working with comps to RPMTransactionItemWrapper
• Implement storing and replaying a transaction
• Log failure to access last makecache time as warning
• [doc] Document Substitutions class
• Dont document removed attribute reports for get_best_selector
• Change the debug log timestamps from UTC to local time

Bugs fixed in 4.4.0:

• :rhbug:`1698145`
• :rhbug:`1848161`
• :rhbug:`1846692`
• :rhbug:`1857029`
• :rhbug:`1853349`
• :rhbug:`1848615`
• :rhbug:`1845800`
• :rhbug:`1872586`
• :rhbug:`1839951`
• :rhbug:`1843280`
• :rhbug:`1862739`
• :rhbug:`1816308`
• :rhbug:`1802074`
9.11 4.2.23 Release Notes

- Fix behavior of install-n, autoremove-n, remove-n, repoquery-n
- Fix behavior of localinstall and list-updateinfo aliases
- Add updated field to verbose output of updateinfo list (RhBug: 1801092)
- Add comment option to transaction (RhBug:1773679)
- Add new API for handling gpg signatures (RhBug:1339617)
- Verify GPG signatures when running dnf-automatic (RhBug:1793298)
- Fix up Conflicts: on python-dnf-plugins-extras
- [doc] Move yum-plugin-post-transaction-actions to dnf-plugins-core
- Remove args “--set-enabled”, “--set-disabled” from DNF (RhBug:1727882)
- Search command is now alphabetical (RhBug:1811802)
- Fix downloading packages with full URL as their location
- repo: catch libdnf.error.Error in addition to RuntimeError in load() (RhBug:1788182)
- History table to max size when redirect to file (RhBug:1786335,1786316)

Bugs fixed in 4.2.23:
- :rhbug:'1339617'
- :rhbug:'1801092'
- :rhbug:'1727882'
- :rhbug:'1786316'
- :rhbug:'1773679'
- :rhbug:'1793298'
- :rhbug:'1788182'
- :rhbug:'1811802'
- :rhbug:'1813244'
- :rhbug:'1786335'

9.12 4.2.21 Release Notes

- Fix completion helper if solv files not in roon cache (RhBug:1714376)
- Add bash completion for ‘dnf module’ (RhBug:1565614)
- Check command no longer reports missing %pre and %post deps (RhBug:1543449)
- Check if arguments can be encoded in ‘utf-8’
- [doc] Remove incorrect information about includepkgs (RhBug:1813460)
Fix crash with “dnf -d 6 repolist” (RhBug:1812682)
Do not print the first empty line for repoinfo
Redirect logger and repo download progress when --verbose
Respect repo priority when listing packages (RhBug:1800342)
[doc] Document that list and info commands respect repo priority
[repoquery] Do not protect running kernel for --unsatisfied (RhBug:1750745)
Remove misleading green color from the “broken dependencies” lines (RhBug:1814192)
[doc] Document color options

Bugs fixed in 4.2.21:
- :rhbug:`1814192`
- :rhbug:`1809600`
- :rhbug:`1565614`
- :rhbug:`1812682`
- :rhbug:`1750745`
- :rhbug:`1813460`
- :rhbug:`1543449`
- :rhbug:`1800342`
- :rhbug:`1812693`

9.13 4.2.19 Release Notes

- match RHEL behavior for CentOS and do not require deltarpm
- List arguments: only first empty value is used (RhBug:1788154)
- Report missing profiles or default as broken module (RhBug:1790967)
- repoquery: fix rich deps matching by using provide expansion from libdnf (RhBug:1534123)
- [documentation] repoquery --what* with multiple arguments (RhBug:1790262)
- Format history table to use actual terminal width (RhBug:1786316)
- Update dnf alias documentation
- Handle custom exceptions from libdnf
- Fix _skipped_packages to return only skipped (RhBug:1774617)
- Add setter for tsi.reason
- Add new hook for commands: Run_resolved
- Add doc entry: include url (RhBug 1786072)
- Clean also .yaml repository metadata
- New API function base.setup_loggers() (RhBug:1788212)
- Use WantedBy=timers.target for all dnf timers (RhBug:1798475)
Bugs fixed in 4.2.19:

- :rhbug:`1798475`
- :rhbug:`1788212`
- :rhbug:`1677774`
- :rhbug:`1786316`
- :rhbug:`1790967`
- :rhbug:`1774617`
- :rhbug:`1534123`
- :rhbug:`1790262`
- :rhbug:`1788154`

9.14 4.2.18 Release Notes

- [doc] Remove note about user-agent whitelist
- Do a substitution of variables in repo_id (RhBug:1748841)
- Respect order of config files in aliases.d (RhBug:1680489)
- Unify downgrade exit codes with upgrade (RhBug:1759847)
- Improve help for `dnf module` command (RhBug:1758447)
- Add shell restriction for local packages (RhBug:1773483)
- Fix detection of the latest module (RhBug:1781769)
- Document the retries config option only works for packages (RhBug:1783041)
- Sort packages in transaction output by nevra (RhBug:1773436)
- Honor repo priority with check-update (RhBug:1769466)
- Strip `”` from aliases when processing (RhBug:1680482)
- Print the whole alias definition in case of infinite recursion (RhBug:1680488)
- Add support of commandline packages by repoquery (RhBug:1784148)
- Running with tsflags=test doesn’t update log files
- Restore functionality of remove --oldinstallonly
- Allow disabling individual aliases config files (RhBug:1680566)

Bugs fixed in 4.2.18:

- :rhbug:`1773483`
- :rhbug:`1758447`
- :rhbug:`1748841`
- :rhbug:`1679008`
- :rhbug:`1680482`
- :rhbug:`1680566`
9.15 4.2.17 Release Notes

- Enable versionlock for check-update command (RhBug:1750620)
- Add error message when no active modules matched (RhBug:1696204)
- Log mirror failures as warning when repo load fails (RhBug:1713627)
- `dnf-automatic`: Change all systemd timers to a fixed time of day (RhBug:1754609)
- DNF can use config from the remote location (RhBug:1721091)
- [doc] update reference to plugin documentation (RhBug:1706386)
- [yum compatibility] Report all packages in repoinfo
- [doc] Add definition of active/inactive module stream
- repoquery: Add a switch to disable modular excludes
- Report more informative messages when no match for argument (RhBug:1709563)
- [doc] Add description of excludes in dnf
- Report more descriptive message when removed package is excluded
- Add module repoquery command
- Fix assumptions about ARMv8 and the way the rpm features work (RhBug:1691430)
- Add Requires information into module info commands
- Enhance inheritance of transaction reasons (RhBug:1672618,1769788)

Bugs fixed in 4.2.17:

- :rhbug:'1696204'
- :rhbug:'1709563'
- :rhbug:'1721091'
- :rhbug:'1769788'
- :rhbug:'1706386'
- :rhbug:'1750620'
- :rhbug:'1713627'
- :rhbug:'1672618'
- :rhbug:'1754609'
9.16 4.2.16 Release Notes

- Make DNF compatible with FIPS mode (RhBug:1762032)
- Return always alphabetically sorted modular profiles
- Revert “Fix messages for starting and failing scriptlets”

9.17 4.2.15 Release Notes

- Fix downloading local packages into destdir (RhBug:1727137)
- Report skipped packages with identical nevra only once (RhBug:1643109)
- Restore functionality of dnf remove --duplicates (RhBug:1674296)
- Improve API documentation
- Document NEVRA parsing in the man page
- Do not wrap output when no terminal (RhBug:1577889)
- Allow to ship alternative dnf.conf (RhBug:1752249)
- Don’t check if repo is expired if it doesn’t have loaded metadata (RhBug:1745170)
- Remove duplicate entries from “dnf search” output (RhBug:1742926)
- Set default value of repo name attribute to repo id (RhBug:1669711)
- Allow searching in disabled modules using “dnf module provides” (RhBug:1629667)
- Group install takes obsoletes into account (RhBug:1761137)
- Improve handling of vars
- Do not load metadata for repolist commands (RhBug:1697472,1713055,1728894)
- Fix messages for starting and failing scriptlets (RhBug:1724779)
- Don’t show older install-only pkgs updates in updateinfo (RhBug:1649383,1728004)
- Add --ids option to the group command (RhBug:1706382)
- Add --with_cve and --with_bz options to the updateinfo command (RhBug:1750528)

Bugs fixed in 4.2.15:

- :rhbug:`1738837`
- :rhbug:`1674296`
- :rhbug:`1577889`
- :rhbug:`1669711`
- :rhbug:`1643109`
- :rhbug:`1649383`
- :rhbug:`1666236`
- :rhbug:`1728894`
9.18 4.2.11 Release Notes

- Improve modularity documentation (RhBug:1730162,1730162,1730807,1734081)
- Fix detection whether system is running on battery (used by metadata caching timer) (RhBug:1498680)
- New repoquery queryformat: %{reason}
- Print rpm errors during test transaction (RhBug:1730348)
- Fix: –setopt and repo with dots
- Fix incorrectly marked profile and stream after failed rpm transaction check (RhBug:1719679)
- Show transaction errors inside dnf shell (RhBug:1743644)
- Don’t reinstall modified packages with the same NEVRA (RhBug:1644241)
- dnf-automatic now respects versionlock excludes (RhBug:1746562)

Bugs fixed in 4.2.11:
- :rhbug:'1498680'
- :rhbug:'1730348'
- :rhbug:'1719679'
- :rhbug:'1601741'
- :rhbug:'1665636'
- :rhbug:'1739457'
- :rhbug:'1715807'
- :rhbug:'1734081'
- :rhbug:'1739773'
- :rhbug:'1730807'
- :rhbug:'1728252
9.19 4.2.9 Release Notes

- Prevent printing empty Error Summary (RhBug: 1690414)
- [doc] Add user_agent and countme options

9.20 4.2.8 Release Notes

- Enhance synchronization of rpm transaction to swdb
- Accept multiple specs in repoquery options (RhBug:1667898)
- Prevent switching modules in all cases (RhBug:1706215)
- [history] Don’t store failed transactions as succeeded
- [history] Do not require root for informative commands
- [dnssec] Fix UnicodeWarning when using new rpm (RhBug:1699650)
- Print rpm error messages during transaction (RhBug:1677199)
- Report missing default profile as an error (RhBug:1669527)
- Apply excludes before modular excludes (RhBug:1709453)
- Improve help for command line arguments (RhBug:1659328)
- [doc] Describe a behavior when plugin is removed (RhBug:1700741)
- Add new modular API method ModuleBase.get_modules
- Mark features used by ansible, anaconda and subscription-manager as an API

Bugs fixed in 4.2.8:

- :rhbug:‘1630113’
- :rhbug:‘1653736’
- :rhbug:‘1669527’
- :rhbug:‘1661814’
- :rhbug:‘1667898’
- :rhbug:‘1673075’
- :rhbug:‘1677199’
- :rhbug:‘1699650’
- :rhbug:‘1700741’
9.21 4.2.7 Release Notes

- Set default to skip_if_unavailable=false (RhBug:1679509)
- Fix package reinstalls during yum module remove (RhBug:1700529)
- Fail when “-c” option is given nonexistent file (RhBug:1512457)
- Reuse empty lock file instead of stopping dnf (RhBug:1581824)
- Propagate comps ‘default’ value correctly (RhBug:1674562)
- Better search of provides in /(s)bin/ (RhBug:1657993)
- Add detection for armv7hcnl (RhBug:1691430)
- Fix group install/upgrade when group is not available (RhBug:1707624)
- Report not matching plugins when using –enableplugin/–disableplugin (RhBug:1673289) (RhBug:1467304)
- Add support of modular FailSafe (RhBug:1623128)
- Replace logrotate with build-in log rotation for dnf.log and dnf.rpm.log (RhBug:1702690)

Bugs fixed in 4.2.7:
- :rhbug:'1702690'
- :rhbug:'1672649'
- :rhbug:'1467304'
- :rhbug:'1673289'
- :rhbug:'1674562'
- :rhbug:'1581824'
- :rhbug:'1709783'
- :rhbug:'1512457'
- :rhbug:'1673913'

9.22 4.2.6 Release Notes

- librepo: Turn on debug logging only if debuglevel is greater than 2 (RhBug:1355764,1580022)
- Fix issues with terminal hangs when attempting bash completion (RhBug:1702854)
- Rename man page from dnf.automatic to dnf-automatic to match command name
- [provides] Enhanced detecting of file provides (RhBug:1702621)
- [provides] Sort the output packages alphabetically

Bugs fixed in 4.2.6:
- :rhbug:'1355764'
- :rhbug:'1580022'
9.23 4.2.5 Release Notes

- Fix multilib obsoletes (RhBug:1672947)
- Do not remove group package if other packages depend on it
- Remove duplicates from “dnf list” and “dnf info” outputs
- Installroot now requires absolute path
- Fix the installation of completion_helper.py
- Allow globs in setopt in repoid part
- Fix formatting of message about free space required
- [doc] Add info of relation update_cache with fill_sack (RhBug:1658694)
- Fix installation failure when duplicate RPMs are specified (RhBug:1687286)
- Add command abbreviations (RhBug:1634232)
- Allow plugins to terminate dnf (RhBug:1701807)

Bugs fixed in 4.2.5:

- :rhbug:`1701807`
- :rhbug:`1634232`
- :rhbug:`1687286`
- :rhbug:`1658694`
- :rhbug:`1672947`

9.24 4.2.2 Release Notes

- [conf] Use environment variables prefixed with DNF_VAR_
- Enhance documentation of –whatdepends option (RhBug:1687070)
- Allow adjustment of repo from –repofrompath (RhBug:1689591)
- Document cachepath option (RhBug:1691365)
- Retain order of headers in search results (RhBug:1613860)
- Solve traceback with the “dnf install @module” (RhBug:1688823)
- Build “yum” instead of “dnf-yum” on Fedora 31

Bugs fixed in 4.2.2:

- :rhbug:`1689591`
- :rhbug:`1687070`
9.25 4.2.1 Release Notes

• Do not allow direct module switch (RhBug:1669491)
• Use improved config parser that preserves order of data
• Fix alias list command (RhBug:1666325)
• Postpone yum conflict to F31
• Update documentation: implemented plugins; options; deprecated commands (RhBug:1670835,1673278)
• Support zchunk (“.zck”) compression
• Fix behavior of --bz option when specifying more values
• Follow RPM security policy for package verification
• Update modules regardless of installed profiles
• Add protection of yum package (RhBug:1639363)
• Fix list --showduplicates (RhBug:1655605)

Bugs fixed in 4.2.1:
• :rhbug:`1655605`
• :rhbug:`1669247`
• :rhbug:`1670835`
• :rhbug:`1673278`
• :rhbug:`1677640`
• :rhbug:`1597182`
• :rhbug:`1666325`
• :rhbug:`1678689`
• :rhbug:`1669491`

9.26 4.1.0 Release Notes

• Allow to enable modules that break default modules (RhBug:1648839)
• Enhance documentation - API examples
• Add best as default behavior (RhBug:1670776,1671683)
• Add --nobest option

Bugs fixed in 4.1.0:
• :rhbug:`1585509`
• :rhbug:`1672432`
• :rhbug:`1509393`
• :rhbug:`1667423`
• :rhbug:`1656726`
• :rhbug:`1671683`
9.27 4.0.10 Release Notes

- Updated difference YUM vs. DNF for yum-updateonboot
- Added new command `dnf alias [options] [list|add|delete] [<name>...]` to allow the user to define and manage a list of aliases
- Enhanced documentation
- Unifying return codes for remove operations
- [transaction] Make transaction content available for commands
- Triggering transaction hooks if no transaction (RhBug:1650157)
- Add hotfix packages to install pool (RhBug:1654738)
- Report group operation in transaction table
- [sack] Change algorithm to calculate rpmdb_version

Bugs fixed in 4.0.10:

- :rhbug:`1654738`
- :rhbug:`1495482`

9.28 4.0.9 Release Notes

- Added `dnf.repo.Repo.get_http_headers()`
- Added `dnf.repo.Repo.set_http_headers()`
- Added `dnf.repo.Repo.add_metadata_type_to_download()`
- Added `dnf.repo.Repo.get_metadata_path()`
- Added `dnf.repo.Repo.get_metadata_content()`
- Added `--changelogs` option for check-update command
- [module] Add information about active modules
- Hide messages created only for logging
- Enhanced `--setopt` option
- [module] Fix `dnf remove @<module>`
- [transaction] Make transaction content available for plugins

Bugs fixed in 4.0.9:

- :rhbug:`1541832`
- :rhbug:`1642796`
- :rhbug:`1637148`
- :rhbug:`1639998`
- :rhbug:`1615164`
9.29 4.0.4 Release Notes

- Add dnssec extension
- Set termforce to AUTO to automatically detect if stdout is terminal
- Repoquery command accepts –changelogs option (RhBug:1483458)
- Calculate sack version from all installed packages (RhBug:1624291)
- [module] Allow to enable module dependencies (RhBug:1622566)

Bugs fixed in 4.0.4:

- :rhbug:'1508649'
- :rhbug:'1590690'
- :rhbug:'1624291'
- :rhbug:'1631217'
- :rhbug:'1489308'
- :rhbug:'1625879'
- :rhbug:'1483458'
- :rhbug:'1497171'
- :rhbug:'1620242'

9.30 3.6.1 Release Notes

- [module] Improved module commands list, info
- [module] Reports error from module solver

Bugs fixed in 3.6.1:

- :rhbug:'1626011'
- :rhbug:'1631458'
- :rhbug:'1305340'
- :rhbug:'1305340'
- :rhbug:'1623866'
- :rhbug:'1600444'
- :rhbug:'1628056'

9.31 3.5.1 Release Notes

- [module] Fixed list and info subcommands
9.32 3.5.0 Release Notes

- New implementation of modularity

9.33 3.0.2 Release Notes

- Add limited compatibility with dnf-2.0 (constants)

9.34 3.0.1 Release Notes

- Support of MODULES - new DNF command `module`
- `dnf.conf.Conf.proxy_auth_method`
- New repoquery option `--depends` and `--whatdepends`
- Enhanced support of variables
- Enhanced documentation

Bugs fixed in 3.0.1:

- `:rhbug:`1565599`
- `:rhbug:`1508839`
- `:rhbug:`1506486`
- `:rhbug:`1506475`

9.35 2.7.5 Release Notes

- Improved performance for excludes and includes handling
- Fixed problem of handling checksums for local repositories
- Fix traceback when using dnf.Base.close()

Bugs fixed in 2.7.5:

- :rhbug:`1502106`
- :rhbug:`1500361`
- :rhbug:`1503575`

9.36 2.7.4 Release Notes

- Enhanced performance for excludes and includes handling
- Solved memory leaks at time of closing of dnf.Base()

Bugs fixed in 2.7.4:

- :rhbug:`1480979`
- :rhbug:`1461423`
- :rhbug:`1499564`
- :rhbug:`1499534`
- :rhbug:`1499623`

9.37 2.7.3 Release Notes

Bugs fixed in 2.7.3:

- :rhbug:`1472847`
- :rhbug:`1498426`
- :rhbug:`1427144`

9.38 2.7.2 Release Notes

API additions in 2.7.2:

- Added new option `--comment=<comment>` that adds a comment to transaction in history
- `dnf.Base.pre_configure_plugin()` configure plugins by running their `pre_configure()` method
- Added `pre_configure()` method for plugins and commands to configure dnf before repos are loaded

Bugs fixed in 2.7.2:

- :rhbug:`1421478`
- :rhbug:`1491560`
9.39 2.6.3 Release Notes

API additions in 2.6.3:

• Added auto substitution for all variables used for repo creation by `dnf.repodict.RepoDict.add_new_repo()`
• Added description of `--downloaddir=<path>` dnf option

Bugs fixed in 2.6.3:

• :rhbug:`1476215`
• :rhbug:`1473964`
• :rhbug:`1359482`
• :rhbug:`1476834`
• :rhbug:`1244755`
• :rhbug:`1476748`
• :rhbug:`1476464`
• :rhbug:`1464192`
• :rhbug:`1463107`
• :rhbug:`1426196`
• :rhbug:`1457507`

9.40 2.6.2 Release Notes

API additions in 2.6.2:

• `dnf.conf.Conf.basearch`
- `dnf.conf.Conf.arch`
- `dnf.conf.Conf.ignorearch`
- Introduced new configuration option `autocheck_running_kernel`
- `dnf.subject.Subject.get_best_selector()` can use three additional key words: `obsoletes`, `reports`, and `reponame`.

From commandline it is possible to use new option `--noautoremove` to disable removal of dependencies that are no longer used.

Bugs fixed in 2.6.2:
- :rhbug:`1279001`
- :rhbug:`1397848`
- :rhbug:`1361424`
- :rhbug:`1387925`
- :rhbug:`1332099`
- :rhbug:`1470116`
- :rhbug:`1161950`
- :rhbug:`1320254`
- :rhbug:`1424723`
- :rhbug:`1462486`
- :rhbug:`1314405`
- :rhbug:`1457368`
- :rhbug:`139280`
- :rhbug:`1138978`
- :rhbug:`1423472`
- :rhbug:`1427365`
- :rhbug:`1398871`
- :rhbug:`1432312`

### 9.41 2.5.1 Release Notes

API additions in 2.5.1:
- `dnf.Plugin.pre_transaction()` is a hook that is called just before transaction execution.
- `dnf.subject.Subject.get_nevra Possibilities()` returns generator for every possible nevra.

Bugs fixed in 2.5.1:
- :rhbug:`1456419`
- :rhbug:`1445021`
- :rhbug:`1400714`
- :rhbug:`1250702`
9.42 2.5.0 Release Notes

API additions in 2.5.0:

```python
dnf.callback.DownloadProgress.start() can use one additional key word total_drpms.
```

Bugs fixed in 2.5.0:

- :rhbug:`1350546`
- :rhbug:`1449618`
- :rhbug:`1270451`
- :rhbug:`1254966`
- :rhbug:`1426787`
- :rhbug:`1293983`
- :rhbug:`1370062`
- :rhbug:`1293067`
- :rhbug:`1393814`
- :rhbug:`1398040`
- :rhbug:`1342157`
- :rhbug:`1379906`
- :rhbug:`1198975`

9.43 2.4.1 Release Notes

DNF command additions in 2.4.1:

```
dnf [options] repoquery --userinstalled limit the resulting set only to packages installed by user.
```

Bugs fixed in 2.4.1:

- :rhbug:`1446756`
- :rhbug:`1446432`
- :rhbug:`1446641`
- :rhbug:`1278124`
- :rhbug:`1301868`
9.44 2.4.0 Release Notes

API additions in 2.4.0:

- `dnf.subject.Subject.get_best_query()` can use two additional key words: `with_nevra`, and `with_filenames`.
- Added description of `dnf.repo.Repo.cost`
- Added description of `dnf.repo.Repo.excludepkgs`
- Added description of `dnf.repo.Repo.includepkgs`

DNF command additions in 2.4.0:

- `--enableplugin=<plugin names>` command line argument enable the listed plugins specified by names or globs.
- `--releasever=<release>` command line argument now autodetect releasever in installroot from host if `/ value is used as <release>`.

Bugs fixed in 2.4.0:

- :rhbug:`1302935`
- :rhbug:`1248684`
- :rhbug:`1441636`
- :rhbug:`1438438`
- :rhbug:`1256313`
- :rhbug:`1161950`
- :rhbug:`1421244`

9.45 2.3.0 Release Notes

API additions in 2.3.0:

- `dnf.package.Package.remote_location()` returns location from where the package can be downloaded from.

DNF command additions in 2.3.0:

- `dnf [options] repoquery --whatconflicts <capability>` limit the resulting set only to packages that conflict <capability>.
- `dnf [options] repoquery --whatobsoletes <capability>` limit the resulting set only to packages that obsolete <capability>.
- `dnf [options] repoquery --location` show a location where the package could be downloaded from.
- `dnf [options] repoquery --nvr` show found packages in format name-version-release.
- `dnf [options] repoquery --nevra` show found packages in format name-epoch:version-release.architecture (default).
- `dnf [options] repoquery --envra` show found packages in format epoch:name-version-release.architecture.
• dnf [options] repoquery --recursive query packages recursively. Can be used with
   --whatrequires <REQ> (optionally with --alldeps, but it has no effect with --exactdeps), or with
   --requires <REQ> --resolve.

Bugs fixed in 2.3.0:
   • :rhbug:`1290137`
   • :rhbug:`1349314`
   • :rhbug:`1247122`
   • :rhbug:`1298717`

9.46 2.2.0 Release Notes

API additions in 2.2.0:
   • dnf.callback.TransactionProgress.progress() has new actions: TRANS_PREPARATION,
     TRANS_POST, and PKG_SCRIPTLET.

Bugs fixed in 2.2.0:
   • :rhbug:`1411432`
   • :rhbug:`1406130`
   • :rhbug:`1411423`
   • :rhbug:`1369212`

9.47 2.1.1 Release Notes

Bugs fixed in 2.1.1:
   • :rhbug:`1417542`
   • :rhbug:`1401446`
   • :rhbug:`1416699`
   • :rhbug:`1427132`
   • :rhbug:`1397047`
   • :rhbug:`1379628`
   • :rhbug:`1424939`
   • :rhbug:`1396992`
   • :rhbug:`1412970`

9.48 2.1.0 Release Notes

API additions in 2.1.0:
   • dnf.Base.update_cache() downloads and caches in binary format metadata for all known repos.

Bugs fixed in 2.1.0:
9.49 2.0.1 Release Notes

API changes in 2.0.1:
- `dnf.Base.package_downgrade()` now accept keyword strict to ignore problems with dep-solving

API additions in 2.0.1:
- `dnf.Base.autoremove()` removes all ‘leaf’ packages from the system that were originally installed as dependencies
- `dnf.cli.Cli.redirect_logger()` changes minimal logger level for terminal output to stdout and stderr

DNF command additions in 2.0.1:
- `dnf [options] shell [filename]` opens an interactive shell for conducting multiple commands during a single execution of DNF
- `dnf [options] swap <remove-spec> <install-spec>` removes spec and install spec in one transaction

Bugs fixed in 2.0.1:
- :rhbug:`1409361`
- :rhbug:`1414512`
- :rhbug:`1238808`
- :rhbug:`1386085`
- :rhbug:`1286553`
- :rhbug:`1337731`
- :rhbug:`1336879`
- :rhbug:`1173349`
- :rhbug:`1329617`
- :rhbug:`1283255`
- :rhbug:`1369411`
- :rhbug:`1243393`
- :rhbug:`1243393`
- :rhbug:`1411349`
- :rhbug:`1345976`
- :rhbug:`1369212`
- :rhbug:`1349247`
- :rhbug:`1403930`
- :rhbug:`1403465`
9.50 2.0.0 Release Notes

List of all incompatible changes can be found at: dnf-1 vs dnf-2

API changes in 2.0.0:

- `dnf.Base.add_remove_rpms()` now suppresses any error if strict equals to False.
- `dnf.Base.read_comps()` now limits results to system basearch if arch_filter equals to True.
- `dnf.cli.Cli.configure()` now doesn’t take any additional arguments.
- `dnf.cli.Cli.run()` now doesn’t take any additional arguments.
- `dnf.Plugin.read_config()` now doesn’t take any name of config file.
- `dnf.Repo.__init__()` now takes `parent_conf` argument which is an instance of `dnf.conf.Conf` holding main dnf configuration instead of `cachedir` path.
- `exclude` and `include` configuration options change to `excludepkgs` and `includepkgs`.

API additions in 2.0.0:

- `dnf.Base.init_plugins()` initializes plugins. It is possible to disable some plugins by passing the list of their name patterns to `disabled_glob`.
- `dnf.Base.configure_plugins()` configures plugins by running their `configure()` method.
- `dnf.Base.urlopen()` opens the specified absolute `url` and returns a file object which respects proxy setting even for non-repo downloads
- Introduced new configuration options: `check_config_file_age`, `clean_requirements_on_remove`, `deltarpm_percentage`, `exit_on_lock`, `get_reposdir`, `group_package_types`, `installonlypkgs`, `keepcache`, `protected_packages`, `retries`, `type`, and `upgrade_group_objects_upgrade`. For detailed description see: DNF API.
- Introduced new configuration methods: `dump()` and `write_raw_configfile()`. For detailed description see: DNF API.
- Introduced `dnf.package.Package` attributes `debug_name`, `downloadsize`, `source_debug_name` and `source_name`. For detailed description see: DNF Package API.
- `dnf.query.Query.extras()` returns a new query that limits the result to installed packages that are not present in any repo.
- `dnf.repo.Repo.enable_debug_repos()` enables debug repos corresponding to already enabled binary repos.
- `dnf.repo.Repo.enable_source_repos()` enables source repos corresponding to already enabled binary repos.
- `dnf.repo.Repo.dump()` prints repository configuration, including inherited values.
- `dnf.query.Query.filter()` now accepts optional argument `pkg`.

DNF command changes in 2.0.0:
**dnf Documentation, Release stable**

- `dnf [options] group install [with-optional] <group-spec>...` changes to `dnf [options] group install [--with-optional] <group-spec>...`

- `dnf [options] list command [package-name-specs]...` changes to `dnf [options] list --command <package-name-specs>...`.

- `dnf repoquery --duplicated` changes to `dnf repoquery --duplicates`.

- `dnf [options] search [all] <keywords>...` changes to `dnf [options] search [--all] <keywords>...`

- `dnf [options] updateinfo [availability] [spec]...` changes to `dnf [options] updateinfo [--summary|--list|--info] [availability] [spec]...`

- `--disablerepo command line argument` is mutually exclusive with `--repo`.

- `--enablerepo command line argument` now appends repositories.

- `--installroot command line argument`. For detailed description see: DNF command API.

- `--releaserv er command line argument` now doesn’t detect release number from running system.

- `--reposfrompath command line argument` can now be combined with `--repo` instead of `--enablerepo`.

- Alternative of yum’s deplist changes from `dnf repoquery` to `requires` instead of `--enablerepo`.

- New systemd units `dnf-automatic-notifyonly`, `dnf-automatic-download`, `dnf-automatic-download` were added for a better customizability of `dnf-automatic`

**DNF command additions in 2.0.0:**

- `dnf [options] remove --duplicates` removes older version of duplicated packages.

- `dnf [options] remove --oldinstallonly` removes old installonly packages keeping only `installonly_limit` latest versions.

- `dnf [options] repoquery [select-options] [query-options] [pkg-spec]` searches the available DNF repositories for selected packages and displays the requested information about them. It is an equivalent of `rpm -q` for remote repositories.

- `dnf [options] repoquery --querytags` provides list of recognized tags by repoquery option `queryformat`.

- `--repo command line argument` enables just specific repositories by an id or a glob. Can be used multiple times with accumulative effect. It is basically shortcut for `--disablerepo="*" --enablerepo=<repoid>` and is mutually exclusive with `--disablerepo` option.

- New commands have been introduced: `check` and `upgrade-minimal`.

- New security options introduced: `bugfix`, `enhancement`, `newpackage`, `security`, `advisory`, `bzs`, `cves`, `sec-severity` and `secseverity`.

**Bugs fixed in 2.0.0:**

9.51 1.1.10 Release Notes

Fixed unicode handling and fixing other bugs.

Bugs fixed in 1.1.10:

- :rhbug:'1257965'
- :rhbug:'1352130'
- :rhbug:'1343764'
- :rhbug:'1308994'
- :rhbug:'1230183'
- :rhbug:'1295090'
- :rhbug:'1325869'
- :rhbug:'1338046'
- :rhbug:'1214768'
- :rhbug:'1338504'
- :rhbug:'1338564'

9.52 1.1.9 Release Notes

From this release if you use any non-API methods warning will be printed and bugfixes.

Bugs fixed in 1.1.9:

- :rhbug:'1324086'
- :rhbug:'1332012'
- :rhbug:'1292892'
- :rhbug:'1328674'
- :rhbug:'1286556'
- :rhbug:'1245121'

9.53 1.1.8 Release Notes

Improvements in documentation, bugfixes, translation updates.

Bugs fixed in 1.1.8:

- :rhbug:'1309408'
- :rhbug:'1209649'
- :rhbug:'1272977'
- :rhbug:'1322226'
- :rhbug:'1315349'
- :rhbug:'1214562'
9.54 1.1.7 Release Notes

Added `dnf.rpm.basearch()` method, intended for the detection of CPU base architecture. The `group list` command was enriched with `installed` and `available` switches.

Documented a standard way of overriding autodetected architectures in `DNF API`.

Bugs fixed in 1.1.7:

- :rhbug:`1313215`
- :rhbug:`1306057`
- :rhbug:`1289164`

9.55 1.1.6 Release Notes

Added support of socks5 proxy.

Bugs fixed in 1.1.6:

- :rhbug:`1291895`
- :rhbug:`1256587`
- :rhbug:`1287221`
- :rhbug:`1277360`
- :rhbug:`1294241`
- :rhbug:`1289166`
- :rhbug:`1294355`
- :rhbug:`1226322`
- :rhbug:`1275878`
- :rhbug:`1239274`
9.56 1.1.5 Release Notes

Improved the start-up time of bash completion.
Reviewed documentation.

Bugs fixed in 1.1.5:
- :rhbug:'1286619'
- :rhbug:'1229046'
- :rhbug:'1282250'
- :rhbug:'1265391'
- :rhbug:'1283017'
- :rhbug:'1278592'
- :rhbug:'1260421'
- :rhbug:'1278382'
- :rhbug:'1230820'
- :rhbug:'1280240'

9.57 1.1.4 Release Notes

API additions in 1.1.4:
- newly added dnf.Query.duplicated()
- extended dnf.Query.latest()

Bugs fixed in 1.1.4:
- :rhbug:'1278031'
- :rhbug:'1264032'
- :rhbug:'1209056'
- :rhbug:'1274946'

9.58 1.1.3 Release Notes

Now dnf.Base.group_install() is able to exclude mandatory packages of the group from transaction.

9.59 1.1.2 Release Notes

Implemented –downloadonly command line option.

Bugs fixed in 1.1.2:
- :rhbug:'1262082'
- :rhbug:'1250038'
9.60 1.1.1 Release Notes

Implemented `dnf mark` command.

Bugs fixed in 1.1.1:
- :rhbug:`1249319`
- :rhbug:`1234763`
- :rhbug:`1242946`
- :rhbug:`1225225`
- :rhbug:`1254687`
- :rhbug:`1247766`
- :rhbug:`1125925`
- :rhbug:`1210289`

9.61 1.1.0 Release Notes

API additions in 1.1.0:
- `dnf.Base.do_transaction()` now accepts multiple displays.
- Introduced `install_weak_deps configuration` option.
- Implemented `strict configuration` option.

API deprecations in 1.1.0:
- `dnf.callback.LoggingTransactionDisplay` is deprecated now. It was considered part of API despite the fact that it has never been documented. Use `dnf.callback.TransactionProgress` instead.

Bugs fixed in 1.1.0
- :rhbug:`1210445`
- :rhbug:`1218401`
9.62 1.0.2 Release Notes

When a transaction is not successfully finished, DNF preserves downloaded packages until the next successful trans-
action even if keepcache option is set to False.

Maximum number of simultaneous package downloads can be adjusted by newly added max_parallel_downloads configuration option.

--repofrompath command line argument was introduced for temporary configuration of repositories.

API additions in 1.0.2:

dnf.package.Query.filter's keys requires and provides now accepts list of Hawkey.Reldep type.

Bugs fixed in 1.0.2:

• :rhbug:'1148630'
• :rhbug:'1176351'
• :rhbug:'1210445'
• :rhbug:'1173107'
• :rhbug:'1219199'
• :rhbug:'1220040'
• :rhbug:'1230975'
• :rhbug:'1232815'
• :rhbug:'1113384'
• :rhbug:'1133979'
• :rhbug:'1238958'
9.63 1.0.1 Release Notes

DNF follows the Semantic Versioning as defined at http://semver.org/.

Documented SSL configuration and repository options.

Added virtual provides allowing installation of DNF commands by their name in the form of `dnf install dnf-command(name)`.

`dnf-automatic` now by default waits random interval between 0 and 300 seconds before any network communication is performed.

Bugs fixed in 1.0.1:
- :rhbug:'1214968'
- :rhbug:'1222694'
- :rhbug:'1225246'
- :rhbug:'1213985'
- :rhbug:'1225277'
- :rhbug:'1223932'
- :rhbug:'1223614'
- :rhbug:'1203661'
- :rhbug:'1187741'

9.64 1.0.0 Release Notes

Improved documentation of YUM to DNF transition in `Changes in DNF CLI compared to YUM`.

`Auto remove command` does not remove `installonly` packages.

`Downgrade command` downgrades to specified package version if that is lower than currently installed one.

DNF now uses `dnf.repo.Repo.id` as a default value for `dnf.repo.Repo.name`.

Added support of repositories which use basic HTTP authentication.

API additions in 1.0.0:
- `configuration` options `username` and `password` (HTTP authentication)
- `dnf.repo.Repo.username` and `dnf.repo.Repo.password` (HTTP authentication)

Bugs fixed in 1.0.0:
- :rhbug:'1215560'
- :rhbug:'1199648'
- :rhbug:'1208773'
- :rhbug:'1208018'
9.65 0.6.5 Release Notes

Python 3 version of DNF is now default in Fedora 23 and later.
yum-dnf package does not conflict with yum package.

dnf erase was deprecated in favor of dnf remove.
Extended documentation of handling non-existent packages and YUM to DNF transition in Changes in DNF CLI compared to YUM.

API additions in 0.6.5:
Newly added `pluginconfpath` option in configuration.
Exposed `skip_if_unavailable` attribute from Repository Configuration.
Documented `IOError` exception of method `fill_sack` from `dnf.Base`.

Bugs fixed in 0.6.5:

- :rhbug:`1203151`
- :rhbug:`1187579`
- :rhbug:`1185977`
- :rhbug:`1195240`
- :rhbug:`1193914`
- :rhbug:`1195385`
- :rhbug:`1160806`
- :rhbug:`1186710`
- :rhbug:`1207726`
- :rhbug:`1157233`
- :rhbug:`1190671`
- :rhbug:`1191579`
- :rhbug:`1195325`
- :rhbug:`1154202`
- :rhbug:`1189083`
- :rhbug:`1193915`
- :rhbug:`1195661`
- :rhbug:`1190458`
9.66 0.6.4 Release Notes

Added example code snippets into DNF Use Cases.

Shows ordered groups/environments by display_order tag from cli and Comps, or the Distribution Compose Metadata DNF API.

In commands the environment group is specified the same as group.

skip_if_unavailable configuration option affects the metadata only.

added enablegroups, minrate and timeout configuration options

API additions in 0.6.4:

Documented install_set and remove_set attributes from Transaction.

Exposed downloadsize, files, installsize attributes from Package.

Bugs fixed in 0.6.4:

- :rhbug:'1155877'
- :rhbug:'1175466'
- :rhbug:'1175466'
- :rhbug:'1186461'
- :rhbug:'1170156'
- :rhbug:'1184943'
- :rhbug:'1177002'
- :rhbug:'1169165'
- :rhbug:'1167982'
- :rhbug:'1157233'
- :rhbug:'1138096'
- :rhbug:'1181189'
- :rhbug:'1181397'
- :rhbug:'1175434'
- :rhbug:'1162887'
- :rhbug:'1156084'
- :rhbug:'1175098'
- :rhbug:'1174136'
- :rhbug:'1055910'
- :rhbug:'1155918'
- :rhbug:'1119030'
- :rhbug:'1177394'
9.67 0.6.3 Release Notes

_Deltarpm_ configuration option is set on by default.

API additions in 0.6.3:

- dnf-automatic adds _motd emitter_ as an alternative output

Bugs fixed in 0.6.3:

- :rhbug:`1153543`
- :rhbug:`1151231`
- :rhbug:`1163063`
- :rhbug:`1151854`
- :rhbug:`1151740`
- :rhbug:`1110780`
- :rhbug:`1149972`
- :rhbug:`1150474`
- :rhbug:`995537`
- :rhbug:`1149952`
- :rhbug:`1149350`
- :rhbug:`1170232`
- :rhbug:`1147523`
- :rhbug:`1148208`
- :rhbug:`1109927`

9.68 0.6.2 Release Notes

API additions in 0.6.2:

- Now _dnf.Base.package_install()_ method ignores already installed packages
- _CliError_ exception from _dnf.cli_ documented
- _Autoerase, History, Info, List, Provides, Repolist_ commands do not force a sync of expired _metadata_
- _Install_ command does installation only

Bugs fixed in 0.6.2:

- :rhbug:`909856`
- :rhbug:`1134893`
- :rhbug:`1138700`
- :rhbug:`1070902`
- :rhbug:`1124316`
9.69 0.6.1 Release Notes

New release adds **upgrade-type command** to **dnf-automatic** for choosing specific advisory type updates.

Implemented missing **history redo command** for repeating transactions.

Supports **gpgkey repo config**, **repo_gpgcheck** and **gpgcheck [main]** and **Repo configs**.

Distributing new package **dnf-yum** that provides **/usr/bin/yum** as a symlink to **/usr/bin/dnf**.

API additions in 0.6.1:

- **exclude**, the third parameter of **dnf.Base.group_install()** now also accepts glob patterns of package names.

Bugs fixed in 0.6.1:

- :rhbug:`1132335`
- :rhbug:`1071854`
- :rhbug:`1131969`
- :rhbug:`908764`
- :rhbug:`1130878`
- :rhbug:`1130432`
- :rhbug:`1118236`
- :rhbug:`1109915`

9.70 0.6.0 Release Notes

0.6.0 marks a new minor version of DNF and the first release to support advisories listing with the **updateinfo command**.

Support for the **include configuration directive** has been added. Its functionality reflects YUM’s **includepkgs** but it has been renamed to make it consistent with the **exclude** setting.

Group operations now produce a list of proposed marking changes to group objects and the user is given a chance to accept or reject them just like with an ordinary package transaction.

Bugs fixed in 0.6.0:

- :rhbug:`850912`
- :rhbug:`1055910`
- :rhbug:`1116666`
9.71 0.5.5 Release Notes

The full proxy configuration, API extensions and several bugfixes are provided in this release.

API changes in 0.5.5:
- `cachedir`, the second parameter of `dnf.repo.Repo.__init__() is not optional (the method has always been this way but the documentation was not matching)

API additions in 0.5.5:
- extended description and an example provided for `dnf.Base.fill_sack()`
- `dnf.conf.Conf.proxy`
- `dnf.conf.Conf.proxy_username`
- `dnf.conf.Conf.proxy_password`
- `dnf.repo.Repo.proxy`
- `dnf.repo.Repo.proxy_username`
- `dnf.repo.Repo.proxy_password`

Bugs fixed in 0.5.5:
- :rhbug:`11100946`
- :rhbug:`1117789`
- :rhbug:`1120583`
- :rhbug:`1121280`
- :rhbug:`1122900`
- :rhbug:`1123688`

9.72 0.5.4 Release Notes

Several encodings bugs were fixed in this release, along with some packaging issues and updates to DNF Configuration Reference.

Repository `priority` configuration setting has been added, providing similar functionality to YUM Utils’ Priorities plugin.

Bugs fixed in 0.5.4:
- :rhbug:`1048973`
- :rhbug:`1108908`
- :rhbug:`1116544`
- :rhbug:`1116839`
- :rhbug:`1116845`
- :rhbug:`1117102`
9.73 0.5.3 Release Notes

A set of bugfixes related to i18n and Unicode handling. There is a `-4/-6` switch and a corresponding `ip_resolve` configuration option (both known from YUM) to force DNS resolving of hosts to IPv4 or IPv6 addresses.

0.5.3 comes with several extensions and clarifications in the API: notably `Transaction` is introspectible now, `Query.filter` is more useful with new types of arguments and we’ve hopefully shed more light on how a client is expected to setup the configuration `substitutions`.

Finally, plugin authors can now use a new `resolved()` hook.

API changes in 0.5.3:

- extended description given for `dnf.Base.fill_sack()`
- `dnf.Base.select_group()` has been dropped as announced in 0.4.18 Release Notes

API additions in 0.5.3:

- `dnf.conf.Conf.substitutions`
- `dnf.package.Package.arch`
- `dnf.package.Package.buildtime`
- `dnf.package.Package.epoch`
- `dnf.package.Package.installtime`
- `dnf.package.Package.name`
- `dnf.package.Package.release`
- `dnf.package.Package.sourcerpm`
- `dnf.package.Package.version`
- `dnf.Plugin.resolved()`
- `dnf.query.Query.filter()` accepts suffixes for its argument keys now which change the filter semantics.
- `dnf.rpm`
- `dnf.transaction.TransactionItem`
- `dnf.transaction.Transaction` is iterable now.

Bugs fixed in 0.5.3:

- `:rhbug:1047049`
- `:rhbug:1067156`
- `:rhbug:1093420`
- `:rhbug:1104757`
9.74 0.5.2 Release Notes

This release brings autoremove command that removes any package that was originally installed as a dependency (e.g. had not been specified as an explicit argument to the install command) and is no longer needed.

Enforced verification of SSL connections can now be disabled with the sslverify setting.

We have been plagued with many crashes related to Unicode and encodings since the 0.5.0 release. These have been cleared out now.

There’s more: improvement in startup time, extended globbing semantics for input arguments and better search relevance sorting.

Bugs fixed in 0.5.2:

- :rhbug:`1105009`
- :rhbug:`1110800`
- :rhbug:`1111569`
- :rhbug:`1111997`
- :rhbug:`1112669`
- :rhbug:`1112704`

9.75 0.5.1 Release Notes

Bugfix release with several internal cleanups. One outstanding change for CLI users is that DNF is a lot less verbose now during the dependency resolving phase.

Bugs fixed in 0.5.1:

- :rhbug:`1065882`
- :rhbug:`1081753`
- :rhbug:`1089864`
The biggest improvement in 0.5.0 is complete support for groups and environments, including internal database of installed groups independent of the actual packages (concept known as groups-as-objects from YUM). Upgrading groups is supported now with `group upgrade` too.

To force refreshing of metadata before an operation (even if the data is not expired yet), the refresh option has been added.

Internally, the CLI went through several changes to allow for better API accessibility like granular requesting of root permissions.

API has got many more extensions, focusing on better manipulation with comps and packages. There are new entries in *Changes in DNF CLI compared to YUM* and *DNF User’s FAQ* too.

Several resource leaks (file descriptors, noncollectable Python objects) were found and fixed.

API changes in 0.5.0:

- it is now recommended that either `dnf.Base.close()` is used, or that `dnf.Base` instances are treated as a context manager.

API extensions in 0.5.0:

- `dnf.Base.add_remote_rpms()`
- `dnf.Base.close()`
- `dnf.Base.group_upgrade()`
- `dnf.Base.resolve()` optionally accepts `allow_erasing` arguments now.
- `dnf.Base.package_downgrade()`
- `dnf.Base.package_install()`
- `dnf.Base.package_upgrade()`
- `dnf.cli.demand.DemandSheet`
- `dnf.cli.Command.base`
- `dnf.cli.Command.cli`
- `dnf.cli.Command.summary`
- `dnf.cli.Command.usage`
- `dnf.cli.Command.configure()`
- `dnf.cli.Cli.demands`
- `dnf.comps.Package`
- `dnf.comps.Group.packages_iter()`
- `dnf.comps.MANDATORY` etc.

Bugs fixed in 0.5.0:

- `:rhbug:`1029022`
- `:rhbug:`1051869`
- `:rhbug:`1061780`
- `:rhbug:`1062884`
9.77 0.4.19 Release Notes

Arriving one week after 0.4.18, the 0.4.19 mainly provides a fix to a traceback in group operations under non-root users.

DNF starts to ship separate translation files (.mo) starting with this release.

Bugs fixed in 0.4.19:
- :rhbug:`1077173`
- :rhbug:`1078832`
- :rhbug:`1079621`

9.78 0.4.18 Release Notes

Support for `dnf distro-sync <spec>` finally arrives in this version.

DNF has moved to handling groups as objects, tagged installed/uninstalled independently from the actual installed packages. This has been in YUM as the `group_command=objects` setting and the default in recent Fedora releases. There are API extensions related to this change as well as two new CLI commands: `group mark install` and `group mark remove`.

API items deprecated in 0.4.8 and 0.4.9 have been dropped in 0.4.18, in accordance with our deprecation policy.

API changes in 0.4.18:
- `dnf.queries` has been dropped as announced in `0.4.8 Release Notes`
• `dnf.exceptions.PackageNotFoundError` has been dropped from API as announced in 0.4.9 Release Notes

• `dnf.Base.install()` no longer has to return the number of marked packages as announced in 0.4.9 Release Notes

API deprecations in 0.4.18:

• `dnf.Base.select_group()` is deprecated now. Please use `group_install()` instead.

API additions in 0.4.18:

• `dnf.Base.group_install()`
• `dnf.Base.group_remove()`

Bugs fixed in 0.4.18:

• `:rhbug:`963710`
• `:rhbug:`1067136`
• `:rhbug:`1071212`
• `:rhbug:`1071501`

### 9.79 0.4.17 Release Notes

This release fixes many bugs in the downloads/DRPM CLI area. A bug got fixed preventing a regular user from running read-only operations using `--cacheonly`. Another fix ensures that `metadata_expire=never` setting is respected. Lastly, the release provides three requested API calls in the repo management area.

API additions in 0.4.17:

• `dnf.repodict.RepoDict.all()`
• `dnf.repodict.RepoDict.get_matching()`
• `dnf.repo.Repo.set_progress_bar()`

Bugs fixed in 0.4.17:

• `:rhbug:`1059704`
• `:rhbug:`1058224`
• `:rhbug:`1069538`
• `:rhbug:`1070598`
• `:rhbug:`1070710`
• `:rhbug:`1071323`
• `:rhbug:`1071455`
• `:rhbug:`1071501`
• `:rhbug:`1071518`
• `:rhbug:`1071677`
9.80 0.4.16 Release Notes

The refactorings from 0.4.15 are introducing breakage causing the background `dnf makecache` runs traceback. This release fixes that.

Bugs fixed in 0.4.16:

- `:rhbug:`1069996`

9.81 0.4.15 Release Notes

Massive refactoring of the downloads handling to provide better API for reporting download progress and fixed bugs are the main things brought in 0.4.15.

API additions in 0.4.15:

- `dnf.exceptions.DownloadError`
- `dnf.Base.download_packages()` now takes the optional `progress` parameter and can raise `DownloadError`.
- `dnf.callback.Payload`
- `dnf.callback.DownloadProgress`
- `dnf.query.Query.filter()` now also recognizes `provides` as a filter name.

Bugs fixed in 0.4.15:

- `:rhbug:`1048788`
- `:rhbug:`1065728`
- `:rhbug:`1065879`
- `:rhbug:`1065959`
- `:rhbug:`1066743`

9.82 0.4.14 Release Notes

This quickly follows 0.4.13 to address the issue of crashes when DNF output is piped into another program.

API additions in 0.4.14:

- `Repo.pkgdir`

Bugs fixed in 0.4.14:

- `:rhbug:`1062390`
- `:rhbug:`1062847`
- `:rhbug:`1063022`
- `:rhbug:`1064148`
9.83 0.4.13 Release Notes

0.4.13 finally ships support for delta RPMs. Enabling this can save some bandwidth (and use some CPU time) when downloading packages for updates.

Support for bash completion is also included in this version. It is recommended to use the `generate_completion_cache` plugin to have the completion work fast. This plugin will be also shipped with `dnf-plugins-core-0.0.3`.

The `keepcache` config option has been readded.

Bugs fixed in 0.4.13:

- :rhbug:`909468`
- :rhbug:`1030440`
- :rhbug:`1046244`
- :rhbug:`1055051`
- :rhbug:`1056400`

9.84 0.4.12 Release Notes

This release disables fastestmirror by default as we received many complains about it. There are also several bugfixes, most importantly an issue has been fixed that caused packages installed by Anaconda be removed together with a depending package. It is now possible to use `bandwidth` and `throttle` config values too.

Bugs fixed in 0.4.12:

- :rhbug:`1045737`
- :rhbug:`1048468`
- :rhbug:`1048488`
- :rhbug:`1049025`
- :rhbug:`1051554`

9.85 0.4.11 Release Notes

This is mostly a bugfix release following quickly after 0.4.10, with many updates to documentation.

API additions in 0.4.11:

- `Plugin.read_config()`
- `repo.Metadata`
- `repo.Repo.metadata`

API changes in 0.4.11:

- `Conf.pluginpath` is no longer hard coded but depends on the major Python version.

Bugs fixed in 0.4.11:

- :rhbug:`1048402`
9.86 0.4.10 Release Notes

0.4.10 is a bugfix release that also adds some long-requested CLI features and extends the plugin support with two new plugin hooks. An important feature for plugin developers is going to be the possibility to register plugin’s own CLI command, available from this version.

dnf history now recognizes last as a special argument, just like other history commands.

dnf install now accepts group specifications via the @ character.

Support for the --setopt option has been readded from YUM.

API additions in 0.4.10:

- Command Line Interface Hooks
  - Plugin.name
  - Plugin.__init__() now specifies the second parameter as an instance of .cli.Cli
  - Plugin.sack()
  - Plugin.transaction()
  - repo.repo_id_invalid()

API changes in 0.4.10:

- Plugin authors must specify Plugin.name when authoring a plugin.

Bugs fixed in 0.4.10:

- :rhbug:`967264`
- :rhbug:`1018284`
- :rhbug:`1035164`
- :rhbug:`1036147`
- :rhbug:`1036211`
- :rhbug:`1038403`
- :rhbug:`1038937`
- :rhbug:`1040255`
- :rhbug:`1044502`
- :rhbug:`1044981`
- :rhbug:`1044999`
9.87 0.4.9 Release Notes

Several YUM features are revived in this release. `dnf history rollback` now works again. The `history userinstalled` has been added, it displays a list of packages that the user manually selected for installation on an installed system and does not include those packages that got installed as dependencies.

We’re happy to announce that the API in 0.4.9 has been extended to finally support plugins. There is a limited set of plugin hooks now, we will carefully add new ones in the following releases. New marking operations have been added to the API and also some configuration options.

An alternative to `yum shell` is provided now for its most common use case: replacing a non-leaf package with a conflicting package is achieved by using the `--allowerasing` switch now.

API additions in 0.4.9:

- **Plugin Interface**
- **Logging**
  - `Base.read_all_repos()`
  - `Base.reset()`
  - `Base.downgrade()`
  - `Base.remove()`
  - `Base.upgrade()`
  - `Base.upgrade_all()`
- `Conf.pluginpath`
- `Conf.reposdir`

API deprecations in 0.4.9:

- `PackageNotFoundError` is deprecated for public use. Please catch `MarkingError` instead.

- It is deprecated to use `Base.install()` return value for anything. The method either returns or raises an exception.

Bugs fixed in 0.4.9:

- :rhbug:`884615`
- :rhbug:`963137`
- :rhbug:`991038`
- :rhbug:`1032455`
- :rhbug:`1034607`
- :rhbug:`1036116`

9.88 0.4.8 Release Notes

There are mainly internal changes, new API functions and bugfixes in this release.

Python 3 is fully supported now, the Fedora builds include the Py3 variant. The DNF program still runs under Python 2.7 but the extension authors can now choose what Python they prefer to use.
This is the first version of DNF that deprecates some of its API. Clients using deprecated code will see a message emitted to stderr using the standard Python warnings module. You can filter out `dnf.exceptions.DeprecationWarning` to suppress them.

API additions in 0.4.8:
- `dnf.Base.sack`
- `dnf.conf.Conf.cachedir`
- `dnf.conf.Conf.config_file_path`
- `dnf.conf.Conf.persistdir`
- `dnf.conf.Conf.read()`
- `dnf.package.Package`
- `dnf.query.Query`
- `dnf.subject.Subject`
- `dnf.repo.Repo.__init__()`
- `dnf.sack.Sack`
- `dnf.selector.Selector`
- `dnf.transaction.Transaction`

API deprecations in 0.4.8:
- `dnf.queries` is deprecated now. If you need to create instances of `Subject`, import it from `dnf.subject`. To create `Query` instances it is recommended to use `sack.query()`.

Bugs fixed in 0.4.8:
- :rhubug:`1014563`
- :rhubug:`1029948`
- :rhubug:`1030998`
- :rhubug:`1030297`
- :rhubug:`1030980`

### 9.89 0.4.7 Release Notes

We start to publish the `DNF API Reference` with this release. It is largely incomprehensive at the moment, yet outlines the shape of the documentation and the process the project is going to use to maintain it.

The :ref:`upgrade_requirements_on_install <upgrade_requirements_on_install_dropped>` configuration option was dropped.

Bugs fixed in 0.4.7:
- :rhubug:`1019170`
- :rhubug:`1024776`
- :rhubug:`1025650`
9.90 0.4.6 Release Notes

0.4.6 brings two new major features. Firstly, it is the revival of **history undo**, so transactions can be reverted now. Secondly, DNF will now limit the number of installed kernels and **installonly** packages in general to the number specified by **installonly_limit** configuration option.

DNF now supports the **group summary** command and one-word group commands no longer cause tracebacks, e.g. `dnf grouplist`.

There are vast internal changes to **dnf.cli**, the subpackage that provides CLI to DNF. In particular, it is now better separated from the core.

The hawkey library used against DNF from with this versions uses a recent RPMDB loading optimization in **libsolv** that shortens DNF startup by seconds when the cached RPMDB is invalid.

We have also added further fixes to support Python 3 and enabled **librepo’s fastestmirror caching optimization** to tighten the download times even more.

Bugs fixed in 0.4.6:

- :rhbug:`878348`
- :rhbug:`880524`
- :rhbug:`1019957`
- :rhbug:`1020101`
- :rhbug:`1020934`
- :rhbug:`1023486`

9.91 0.4.5 Release Notes

A serious bug causing **tracebacks during package downloads** made it into 0.4.4 and this release contains a fix for that. Also, a basic proxy support has been readded now.

Bugs fixed in 0.4.5:

- :rhbug:`1021087`

9.92 0.4.4 Release Notes

The initial support for Python 3 in DNF has been merged in this version. In practice one can not yet run the **dnf** command in Py3 but the unit tests already pass there. We expect to give Py3 and DNF heavy testing during the Fedora 21 development cycle and eventually switch to it as the default. The plan is to drop Python 2 support as soon as Anaconda is running in Python 3.

Minor adjustments to allow Anaconda support also happened during the last week, as well as a fix to a possibly severe bug that one is however not really likely to see with non-devel Fedora repos:

- :rhbug:`1017278`
9.93 0.4.3 Release Notes

This is an early release to get the latest DNF out with the latest librepo fixing the Too many open files bug.

In Fedora, the spec file has been updated to no longer depend on precise versions of the libraries so in the future they can be released independently.

This release sees the finished refactoring in error handling during basic operations and adds support for group remove and group info commands, i.e. the following two bugs:

- :rhbug:'1013764'
- :rhbug:'1013773'

9.94 0.4.2 Release Notes

DNF now downloads packages for the transaction in parallel with progress bars updated to effectively represent this. Since so many things in the downloading code were changing, we figured it was a good idea to finally drop urlgrabber dependency at the same time. Indeed, this is the first version that doesn’t require urlgrabber for neither build nor run.

Similarly, since librepo started to support this, downloads in DNF now use the fastest mirrors available by default.

The option to specify repositories’ costs has been readded.

Internally, DNF has seen first part of ongoing refactorings of the basic operations (install, update) as well as a couple of new API methods supporting development of extensions.

These bugzillas are fixed in 0.4.2:

- :rhbug:'909744'
- :rhbug:'984529'
- :rhbug:'967798'
- :rhbug:'995459'

9.95 0.4.1 Release Notes

The focus of this release was to support our efforts in implementing the DNF Payload for Anaconda, with changes on the API side of things (better logging, new Base.reset() method).

Support for some irrelevant config options has been dropped (kernelpkgnames, exactarch, rpm_check_debug). We also no longer detect metalinks in the mirrorlist option (see Fedora bug 948788).

DNF is on its way to drop the urlgrabber dependency and the first set of patches towards this goal is already in.

Expect the following bugs to go away with upgrade to 0.4.1:

- :rhbug:'998859'
- :rhbug:'1006366'
- :rhbug:'1008444'
- :rhbug:'1003220'
9.96 0.4.0 Release Notes

The new minor version brings many internal changes to the comps code, most comps parsing and processing is now delegated to libcomps by Jindřich Luža.

The overwrite_groups config option has been dropped in this version and DNF acts if it was 0, that is groups with the same name are merged together.

The currently supported groups commands (group list and group install) are documented on the manpage now.

The 0.4.0 version is the first one supported by the DNF Payload for Anaconda and many changes since 0.3.11 make that possible by cleaning up the API and making it more sane (cleanup of yumvars initialization API, unifying the RPM transaction callback objects hierarchy, slimming down dnf.rpmUtils.arch, improved logging).

Fixes for the following are contained in this version:

- :rhbug:`997403`
- :rhbug:`1002508`
- :rhbug:`1002798`

9.97 0.3.11 Release Notes

The default multilib policy configuration value is best now. This does not pose any change for the Fedora users because exactly the same default had been previously achieved by a setting in /etc/dnf/dnf.conf shipped with the Fedora package.

An important fix to the repo module speeds up package downloads again is present in this release. The full list of fixes is:

- :rhbug:`979042`
- :rhbug:`977753`
- :rhbug:`996138`
- :rhbug:`993916`

9.98 0.3.10 Release Notes

The only major change is that skip_if_unavailable is enabled by default now.

A minor release otherwise, mainly to get a new version of DNF out that uses a fresh librepo. The following issues are now a thing of the past:

- :rhbug:`977661`
- :rhbug:`984483`
- :rhbug:`986545`

9.99 0.3.9 Release Notes

This is a quick bugfix release dealing with reported bugs and tracebacks:
9.100 0.3.8 Release Notes

A new locking module has been integrated in this version, clients should see the message about DNF lock being taken less often.

Panu Matilainen has submitted many patches to this release to cleanup the RPM interfacing modules.

The following bugs are fixed in this release:

- :rhbug:‘908491’
- :rhbug:‘968159’
- :rhbug:‘974427’
- :rhbug:‘974866’
- :rhbug:‘976652’
- :rhbug:‘975858’

9.101 0.3.7 Release Notes

This is a bugfix release:

- :rhbug:‘916662’
- :rhbug:‘967732’

9.102 0.3.6 Release Notes

This is a bugfix release, including the following fixes:

- :rhbug:‘966372’
- :rhbug:‘965410’
- :rhbug:‘963627’
- :rhbug:‘965114’
- :rhbug:‘964467’
- :rhbug:‘963680’
- :rhbug:‘963133’
9.103 0.3.5 Release Notes

Besides few fixed bugs this version should not present any differences for the user. On the inside, the transaction managing mechanisms have changed drastically, bringing code simplification, better maintainability and better testability.

In Fedora, there is a change in the spec file effectively preventing the makecache timer from running immediately after installation. The timer service is still enabled by default, but unless the user starts it manually with systemctl start dnf-makecache.timer it will not run until after the first reboot. This is in alignment with Fedora packaging best practices.

The following bugfixes are included in 0.3.5:

- :rhbug:’958452’
- :rhbug:’959990’
- :rhbug:’961549’
- :rhbug:’962188’

9.104 0.3.4 Release Notes

0.3.4 is the first DNF version since the fork from YUM that is able to manipulate the comps data. In practice, dnf group install <group name> works again. No other group commands are supported yet.

Support for librepo-0.0.4 and related cleanups and extensions this new version allows are included (see the buglist below)

This version has also improved reporting of obsoleted packages in the CLI (the YUM-style “replacing <package-nevra>” appears in the textual transaction overview).

The following bugfixes are included in 0.3.4:

- :rhbug:’887317’
- :rhbug:’914919’
- :rhbug:’922667’

9.105 0.3.3 Release Notes

The improvements in 0.3.3 are only API changes to the logging. There is a new module dnf.logging that defines simplified logging structure compared to YUM, with fewer logging levels and simpler usage for the developers. The RPM transaction logs are no longer in /var/log/dnf.transaction.log but in /var/log/dnf.rpm.log by default.

The exception classes were simplified and moved to dnf.exceptions.

The following bugs are fixed in 0.3.3:

- :rhbug:’950722’
- :rhbug:’903775’
9.106 0.3.2 Release Notes

The major improvement in this version is in speeding up syncing of repositories using metalink by looking at the repomd.xml checksums. This effectively lets DNF cheaply refresh expired repositories in cases where the original has not changed: for instance the main Fedora repository is refreshed with one 30 kB HTTP download. This functionality is present in the current YUM but hasn’t worked in DNF since 3.0.0.

Otherwise this is mainly a release fixing bugs and tracebacks. The following reported bugs are fixed:

- :rhbug:`947258`
- :rhbug:`889202`
- :rhbug:`923384`

9.107 0.3.1 Release Notes

0.3.1 brings mainly changes to the automatic metadata synchronization. In Fedora, `dnf makecache` is triggered via SystemD timers now and takes an optional `background` extra-argument to run in resource-considerate mode (no syncing when running on laptop battery, only actually performing the check at most once every three hours). Also, the IO and CPU priorities of the timer-triggered process are lowered now and shouldn’t as noticeably impact the system’s performance.

The administrator can also easily disable the automatic metadata updates by setting `metadata_timer_sync` to 0.

The default value of `metadata_expire` was increased from 6 hours to 48 hours. In Fedora, the repos usually set this explicitly so this change is not going to cause much impact.

The following reported issues are fixed in this release:

- :rhbug:`916657`
- :rhbug:`921294`
- :rhbug:`922521`
- :rhbug:`926871`
- :rhbug:`878826`
- :rhbug:`922664`
- :rhbug:`892064`
- :rhbug:`919769`
CHAPTER 10

Changes in DNF CLI compared to YUM

10.1 --skip-broken

For install command:

The --skip-broken option is an alias for --setopt=strict=0. Both options could be used with DNF to skip all unavailable packages or packages with broken dependencies given to DNF without raising an error causing the whole operation to fail. This behavior can be set as default in dnf.conf file. See strict conf option.

For upgrade command:

The semantics that were supposed to trigger in YUM with --skip-broken are now set for plain dnf update as a default. There is no need to use --skip-broken with the dnf upgrade command. To use only the latest versions of packages in transactions, there is the --best command line switch.

10.2 Update and Upgrade Commands are the Same

Invoking dnf update or dnf upgrade, in all their forms, has the same effect in DNF, with the latter being preferred. In YUM yum upgrade was exactly like yum --obsoletes update.

10.3 clean_requirements_on_remove on by default

The clean_requirements_on_remove switch is on by default in DNF. It can thus be confusing to compare the “remove” operation results between DNF and YUM as by default DNF is often going to remove more packages.

10.4 No resolvedep command

The YUM version of this command is maintained for legacy reasons only. The user can just use dnf provides to find out what package provides a particular file.
10.5 No deplist command

An alternative to the YUM deplist command to find out dependencies of a package is dnf repoquery --deplist using repoquery command.

Note: Alternatively there is a YUM compatibility support where yum deplist is alias for dnf repoquery --deplist command.

10.6 Excludes and repo excludes apply to all operations

YUM only respects excludes during installs and upgrades. DNF extends this to all operations, among others erasing and listing. If you e.g. want to see a list of all installed python-f* packages but not any of the Flask packages, the following will work:

dnf -x '*flask*' list installed 'python-f*

10.7 The include option has been removed

Inclusion of other configuration files in the main configuration file is no longer supported.

10.8 dnf provides /bin/<file> is not fully supported

After UsrMove there's no directory /bin on Fedora systems and no files get installed there, /bin is only a symlink created by the filesystem package to point to /usr/bin. Resolving the symlinks to their real path would only give the user a false sense that this works, while in fact provides requests using globs such as:

dnf provides /b*/<file>

will fail still (as they do in YUM now). To find what provides a particular binary, use the actual path for binaries on Fedora:

dnf provides /usr/bin/<file>

Also see related Fedora bugzillas 982947 and 982664.

10.9 skip_if_unavailable could be enabled by default

In some distributions DNF is shipped with skip_if_unavailable=True in the DNF configuration file. The reason for the change is that third-party repositories can often be unavailable. Without this setting in the relevant repository configuration file YUM immediately stops on a repository synchronization error, confusing and bothering the user.

See the related Fedora bug 984483.
10.10 **overwrite_groups dropped, comps functions acting as if always disabled**

This config option has been dropped. When DNF sees several groups with the same group ID it merges the groups’ contents together.

10.11 **mirrorlist_expire dropped**

To simplify things for the user, DNF uses `metadata_expire` for both expiring metadata and the mirrorlist file (which is a kind of metadata itself).

10.12 **metalink not recognized in the mirrorlist repo option**

The following part of `yum.conf(5)` no longer applies for the `mirrorlist` option:

As a special hack if the mirrorlist URL contains the word “metalink” then the value of mirrorlist is copied to metalink (if metalink is not set).

The relevant repository configuration files have been fixed to respect this, see the related Fedora bug 948788.

10.13 **alwaysprompt dropped**

Unsupported to simplify the configuration.

10.14 **upgrade_requirements_on_install dropped**

Dropping this config option with blurry semantics simplifies the configuration. DNF behaves as if this was disabled. If the user wanted to upgrade everything to the latest version she’d simply use `dnf upgrade`.

10.15 **dnf history rollback check dropped**

Since DNF tolerates the use of other package managers, it is possible that not all changes to the RPMDB are stored in the history of transactions. Therefore, DNF does not fail if such a situation is encountered and thus the `force` option is not needed anymore.

10.16 **Packages replacement without yum swap**

Time after time one needs to remove an installed package and replace it with a different one, providing the same capabilities while other packages depending on these capabilities stay installed. Without (transiently) breaking consistency of the package database this can be done by performing the remove and the install in one transaction. The common way to set up such a transaction in DNF is to use `dnf shell` or use the `--allowerasing` switch.

E.g. say you want to replace A (providing P) with B (also providing P, conflicting with A) without deleting C (which requires P) in the process. Use:
dnf --allowerasing install B

This command is equal to yum swap A B.
DNF provides swap command but only dnf swap A B syntax is supported

### 10.17 Dependency processing details are not shown in the CLI

During its depsolving phase, YUM outputs lines similar to:

```
---> Package rubygem-rhc.noarch 0:1.16.9-1.fc19 will be an update
--> Processing Dependency: rubygem-net-ssh-multi >= 1.2.0 for package: rubygem-rhc-1.16.9-1.fc19.noarch
```

DNF does not output information like this. The technical reason is that depsolver below DNF always considers all dependencies for update candidates and the output would be very long. Secondly, even in YUM this output gets confusing very quickly especially for large transactions and so does more harm than good.

See the related Fedora bug 1044999.

### 10.18 dnf provides complies with the YUM documentation of the command

When one executes:

```
yum provides sandbox
```

YUM applies extra heuristics to determine what the user meant by sandbox, for instance it sequentially prepends entries from the PATH environment variable to it to see if it matches a file provided by some package. This is an undocumented behavior that DNF does not emulate. Just typically use:

```
dnf provides /usr/bin/sandbox
```

or even:

```
dnf provides */sandbox'
```

to obtain similar results.

### 10.19 Bandwidth limiting

DNF supports the throttle and bandwidth options familiar from YUM. Contrary to YUM, when multiple downloads run simultaneously the total downloading speed is throttled. This was not possible in YUM since downloaders ran in different processes.

### 10.20 installonlypkgs config option

Compared to YUM, DNF appends list values from the installonlypkgs config option to DNF defaults, where YUM overwrites the defaults by option values.
10.21 The usage of Delta RPM files

The boolean `deltarpm` option controls whether delta RPM files are used. Compared to YUM, DNF does not support `deltarpm_percentage` and instead chooses some optimal value of DRPM/RPM ratio to decide whether using `deltarpm` makes sense in the given case.

10.22 Handling .srpm files and non-existent packages

DNF will terminate early with an error if a command is executed requesting an installing operation on a local `.srpm` file:

```
$ dnf install fdn-0.4.17-1.fc20.src.rpm tour-4-6.noarch.rpm
Error: Will not install a source rpm package (fdn-0.4.17-1.fc20.src).
```

The same applies for package specifications that do not match any available package.

YUM will only issue a warning in this case and continue installing the “tour” package. The rationale behind the result in DNF is that a program should terminate with an error if it can not fulfill the CLI command in its entirety.

10.23 Promoting package to install to a package that obsoletes it

DNF will not magically replace a request for installing package X to installing package Y if Y obsoletes X. YUM does this if its `obsoletes` config option is enabled but the behavior is not properly documented and can be harmful.

See the related Fedora bug 1096506 and guidelines for renaming and obsoleting packages in Fedora.

10.24 Behavior of `--installroot` option

DNF offers more predictable behavior of installroot. DNF handles the path differently from the `--config` command-line option, where this path is always related to the host system (YUM combines this path with installroot). Reposdir is also handled slightly differently, if one path of the reposdirs exists inside of installroot, then repos are strictly taken from installroot (YUM tests each path from reposdir separately and use installroot path if existed). See the detailed description for `--installroot` option.

10.25 Different prompt after transaction table

DNF doesn’t provide download functionality after displaying transaction table. It only asks user whether to continue with transaction or not. If one wants to download packages, they can use the ‘download’ command.

10.26 List command shows all repo alternatives

DNF lists all packages from all repos, which means there can be duplicates package names (with different repo name). This is due to providing users possibility to choose preferred repo.
10.27 *yum-langpacks subcommands have been removed*

Translations became part of core DNF and it is no longer necessary to manage individual language packs.

Following sub-commands were removed:

- langavailable
- langinstall
- langremove
- langlist
- langinfo
## Changes in DNF plugins compared to YUM plugins

</tr>
<tr>
<td>package-cleanup --oldkernels--keep=2</td>
<td>dnf remove $(dnf repoquery --installonly --latest-limit=-2)</td>
</tr>
</tbody>
</table>
12.1 yum-updateonboot and yum-cron

DNF does not have a direct replacement of yum-updateonboot and yum-cron commands. However, the similar result can be achieved by dnf automatic command (see DNF Automatic).

You can either use the shortcut:

```
$ systemctl enable --now dnf-automatic-install.timer
```

Or set apply_updates option of /etc/dnf/automatic.conf to True and use generic timer unit:

```
$ systemctl enable --now dnf-automatic.timer
```

The timer in both cases is activated 1 hour after the system was booted up and then repetitively once every 24 hours. There is also a random delay on these timers set to 5 minutes. These values can be tweaked via dnf-automatic*.timer config files located in the /usr/lib/systemd/system/ directory.

12.2 Utilities that have not been ported yet

repo-rss, show-changed-rco, show-installed, verifytree, yum-groups-manager

Take a look at the FAQ about YUM to DNF migration. Feel free to file an RFE for missing functionality if you need it.
Changes in the DNF hook API compared to YUM

This table provides what alternative hooks are available in DNF compared to YUM.

<table>

CHAPTER 14

Changes in DNF-2 compared to DNF-1

14.1 CLI changes

14.1.1 Reintroduction of YUM’s configuration options includepkgs and excludepkgs

Due to a better compatibility with YUM, configuration options include and exclude were replaced by the original options includepkgs and excludepkgs.

14.1.2 DNF group install --with-optional option

Installation of optional packages of group is changed from subcommand with-optional to option --with-optional.

14.2 Python API changes

14.2.1 All non-API methods and attributes are private

Warning: All non-API methods and attributes of documented modules are now private in order to accomplish more distinguishable API.

14.2.2 Following API methods accept different arguments

1. dnf.Base.add_remote_rpms()
2. dnf.Base.group_install()
3. dnf.cli.Command.configure()
4. `dnf.cli.Command.run()`
5. `dnf.Plugin.read_config()`
